

"HOW TO" Measure Tip to Tip Sash Sizes

1. Raise the sash approximately 2". Release tilt latches from frame jambs. Swing top of panel to interior until it reaches a horizontal position. Once at a horizontal position, lift either side of the panel which will rotate the pivot bar in the frame jamb. Once the pivot bar is out of pocket, pull opposite side of sash/pivot bar out of its pocket and remove sash.

NOTE: It is not necessary to remove sash completely to take measurements. Sash can be left in the window frame in a tilted position if preferred.

2. Always measure sash width first. Measure sash frame only. Do not measure woolpile or latches.
