Health and Fitness Industry

Access Guidance Display is a system designed to enhance the experience of customers, members, guests, visitors and staff, on their journey within and during the use of your facilities. The system includes Interactive Information Terminals that provide superior clarity of usability, feedback and information display.

Each AGD unit consists of an LCD colour display – touchscreen, in the case of AGD Unlock & Plus - an embedded processor unit – tablet PC with AGD Plus - and input/output interface board.

Each screen displayed can be bespoke to the customer and can include both visual and text interactive elements, branding and promotional collateral. The units can be programmed with various bespoke functions which can also trigger outputs to interface with other systems. The range consists of three models which are complimentary and compatible with each other and the central management system.

AGD

With its five-inch LCD screen, the AGD interfaces to access control systems in order to provide users with clear instructions and status information when attempting access through secure doors or barriers. Emergency conditions, such as fire alarm activation, can be clearly displayed to enhance safety. In addition, the status of override devices, including breakglass units, can be displayed to indicate to staff that the door/barrier is insecure.

AGD^{UNLOCK}

AGD Unlock has all the functionality of AGD but includes a stunning seven-inch screen. Functionality is further enhanced by the inclusion of a touchscreen keypad for PIN entry. This can be connected to an access control system or used stand-alone, for example, as a staff override facility.

An optional touchscreen Assistance Call function is available which can interface to intercom systems, pager systems etc.

AGD^{PLUS}

AGD Plus is taking the concept of AGD to another level. This includes a beautifully clear ten-inch touchscreen, with all the features of AGD Unlock, but adds enhanced processing capability, network connectivity and interfaces. A range of sensors can be connected to give precise display of environmental conditions within an area; temperature, humidity, luminosity etc.

An enhancement to any single or multi-use facility, AGD Plus integrates to management platforms and databases to contextually display real-time activity and class information.

This includes, room information, ongoing and upcoming activity details such as name, description, start & end times and spaces available/booked. Information can be shown as text only or in graphical (calendar) views.

Single and multi-site solutions are catered for including flexible centralised management and administration via customer network. The system is web server based and is accessed via a dedicated password protected

dashboard. This means that you, and your authorised staff, can access the dashboard from any browser on your network with no additional hardware or software (or continual upgrades) required. Sites or regions can be configured individually; display a promotional offer in one region and advance warning of a site closure for maintenance in another, for instance.

Comparison of AGD versions

	Access Control	Activity Information	Keypad (PIN)	Assistance Call	Room Environment	5 inch Screen	7 inch Screen	10 inch Screen

● Included
⊗ Optional
⊗ No option

Access Control Display:

- Home/Instruction screen
- Access granted screen
- Access denied screen
- Assistance screen
- Emergency/Fire screen
- Door Status
- Other- at customer request

Keypad:

- Touchscreen operation
- Multiple PINs can be stored
- Up to 16-digit PIN length
- Various output protocols for connection to access control systems

Activity Information:

- Management/Database integration
- Room information
- Real-time
 - Class/activity information
 - Start/end time information
 - Space availability/booked information
- text and/or calendar views

Assistance call:

- Touchscreen operation
- Reassurance screen displayed on activation
- Output for interface to intercom/pager system

Integration/Connectivity:

- Isolated hardwired inputs & outputs
- I2C sensor input (AGDplus)
- IP Network (AGDplus)
- Bespoke integration via APIs

Room Environment:

- Standard sensor input protocol
- Temperature, humidity, light level etc.
