Modernize your legacy Windows workloads with Amazon Web Services (AWS)

Migrate unsupported 32-bit Windows Server operating systems now and begin modernizing in an agile, scalable, and secure AWS Cloud

Why organizations are moving mission-critical workloads to the cloud

For a long time, technical decision makers have avoided moving mission-critical workloads, such as Microsoft applications, out of their on-premises data centers. However, as more and more enterprises successfully run enterprise applications on the cloud—reducing costs, increasing agility, and spending less time on non-strategic IT initiatives in the process—organizations are realizing that running their own mission-critical applications on the cloud isn't merely feasible—it's necessary. If you want to maintain and strengthen competitive advantage and deliver superior value for your customers, the constraints of legacy technology are a significant hindrance.
