

SPLICING & RIGGING

A **SPLICE** = A tear and break proof connection of both fibre and wire rope

Splicing and rigging with both synthetic and natural fibre rope is a traditional skill that is indispensable and cannot be replaced by modern machinery. Our team of professional riggers are experienced and competent to take the strands of individual ropes and entwine them to create an end termination or to join ropes together.

The stability of a spliced connection is based on friction and the phenomena of the strands and yarns

self-locking. It is important that you select a professional splicing team that has a complete understanding of the methods and the product to create a safe and strong rope assembly. Inaccurately performed splices can reduce the break load of the rope up to 75% and a perfectly spliced rope will double the break load of a knot termination.

We offer a splicing service to end users as well as our trade and commercial customers.
