Only Wealthy Immigrants Need Apply: A Proposed Federal Rule Change Would Hurt Florida Families and the Economy

Anne Swerlick
October 2018

The Administration’s proposed changes to the “public charge rule” would hurt and cause confusion among families, result in Florida losing hundreds of millions in federal dollars and cause a negative ripple effect in the state’s economy.

A drastic change in the “public charge rule” proposed by the U.S. Department of Homeland Security would restrict access to green cards and various types of visas for immigrants who are not already comparatively well off. This proposal fundamentally changes the U.S.’s approach to immigration, making family income and potential use of health care, nutrition or housing programs a central consideration in whether or not to offer people an opportunity to make their lives in this country. It makes the existing “public charge” standards vastly more restrictive.

The “Chilling” Effect

The direct effect of the rule would fall primarily on people applying for green cards through a family-based petition, where public charge is relevant. Similar standards would also apply to people seeking to extend or change their temporary non-immigrant status in the United States. The rule change would likely lead to the denial of green cards to hundreds of thousands of otherwise eligible applicants for family-based and employment visas.

Beyond that, the proposed rule is also expected — and perhaps intended — to have a widespread chilling effect if implemented. Even people who already have a green card, or who are exempt from the rule, such as refugees or asylees, are expected to be frightened and confused about the potential consequences of applying for food, health and housing supports they are eligible to receive. The chilling effect is the focus of this brief.

The New York-based Fiscal Policy Institute estimates that there are 24 million people in the United States who would be affected by the chilling effect of the proposed rule, including 1.6 million Floridians. Not all

Definition of Terms

Directly affected population: People applying for a green card through a pathway where public charge is relevant, such as petition for a family-based visa or a range of other visas.

People who may experience a chilling effect: The number of people who are likely to be nervous or confused about whether they should apply for benefits if they qualify is a much larger group than the directly affected population. For this paper, it’s estimated to be everyone who lives in a family with at least one non-citizen immigrant, and where someone in that family has received one of the public benefits named in the public charge rule.

Disenrollment from programs: Among the people who experience a chilling effect, the portion that would go so far as to disenroll from programs for which they are eligible. The economic impacts are calculated by starting with the portion of those experiencing the chilling effects who currently receive any benefits, and simulating the impact of disenrollment rates of 15, 25, and 35 percent.
will face a public charge determination, but all are likely to be nervous about applying for benefits, and some portion will in fact disenroll from benefit programs.

The estimate of the population who may experience a chilling effect includes anyone in a family that has received any food, health, or housing supports, and where at least one member of the family is a non-citizen. Based on past experience, there is good reason to believe that when there are changes around immigration and public benefits even people who are not directly targeted by this rule will be affected. Indeed, there is already evidence that significant numbers of immigrants are withdrawing from Women, Infants, Children, known as WIC, despite the fact that the program is not included in the proposed rule and the rule has not yet been implemented.¹

The Proposed Rule Goes Much Too Far

The proposed rule uses the public charge designation as a way to unilaterally change immigration policy, without input from Congress, fundamentally redefining how people think about who an “acceptable” immigrant is and undercutting the very idea of the American Dream.

The pre-existing public charge rule has required immigration officers to evaluate the overall circumstances of immigrants to determine whether they can support themselves in the United States or whether they are likely to rely primarily on the government for support. Under longstanding policy, this has meant showing an applicant will not become primarily dependent on the government—relying, for example, on cash aid from Temporary Assistance for Needy Families, Supplemental Security Income, or General Assistance for their monthly income, or on long-term institutional care.

The proposed rule aggressively reinterprets this longstanding policy. While continuing to look at the overall circumstances of a family, the Proposed Rule would deem immigrants potentially unacceptable if they have received, or are considered likely to receive, even a modest amount of support from any one of a number of non-cash supports: Medicaid, food stamps (SNAP), housing supports, and subsidies for Medicare Part D to reduce the cost of prescription drugs. It would also for the first time make a specific income threshold a central issue in immigration decisions. Having an income of under $15,000 for a single person or $31,000 for a family of four would be weighed negatively and could lead to a denial. Indeed, the rule proposes to weigh a range of factors negatively. The only factor weighed as “heavily positive” is if an applicant has an income or resources of over $30,000 for a single person or $63,000 for a family of four. By way of comparison, the median household income in the United States is $60,000.² In Florida, the median household income is $52,594.³

As noted, only some non-citizens currently in the United States will face this Proposed Rule; many will not. But what would it look like if the Proposed Rule was applied to all non-citizens?

The effect is extreme: In Florida, 26 percent of non-citizens have benefited from health care, food, housing or cash supports. That should come as no surprise: so have 32 percent of U.S.-born Floridians. The fact is, a large number of Americans — whether or not they are immigrants — make use of federal food, health and housing programs in any given year to get through hard times and to advance to a better life.

Most of these programs are structured in significant measure as work supports, helping people with relatively low-wage jobs keep healthy, stay in their homes, and put food on the table. Discouraging families from
making use of these programs when they need them only makes it harder for them to move up the economic ladder and contribute to their fullest capacity to the American economy.

Further Inhumane Treatment of Kids to Pressure Families

The nation was outraged to find out that the Administration has been using the forced separation of children from their parents as an inhumane tactic of immigration enforcement. The redefinition of public charge doubles down on this strategy by inflicting harm on children, whether intentionally or as a side effect of the proposed rule.

Some children will themselves be subject to the proposed rule. A far greater number live in families that will likely experience a chilling effect. In Florida, 580,000 children under 18 years old live in families with at least one non-citizen family member and that have received one of the benefits specified by the proposed rule. The large majority, 480,00 of the 580,000, are United States citizens.

It also pushes parents to make heart-wrenching decisions for their families. The stakes are unbearably high. Parents who apply for SNAP or Medicaid may fear losing the chance to stay in this country with their children. Yet, not applying may mean they see their family go hungry or not being able to see a doctor when they’re sick.

If the proposed rule is put into effect, advocates and service providers will need to work strenuously to clarify which individuals may be directly impacted and which may be relatively safe. But confusion and fear will undoubtedly spread well beyond the directly targeted population.

Helping kids in immigrant families do well is not only the right thing to do, it’s also a sound investment in our state and the country’s future. One of the clearest and most striking findings in a major study of the National Academy of Sciences is that the children of immigrants, once grown, become among the strongest contributors to the country’s economy.\(^6\)

**An Economic Loss for Florida**

Figure 3 looks at the impact of two of the biggest supports the Proposed Rule would affect: SNAP and Medicaid. Estimates of the impacts are provided if 15, 25 and 35 percent of people currently receiving benefits who experience the chilling effect feel compelled to disenroll from programs for which they qualify. This range of disenrollment is derived from studies of prior experiences of big policy changes creating a chilling effect for immigrants, such as the welfare reform bill of the 1990s.\(^7\)

Source: Estimate of direct loss was calculated by the Center on Budget and Policy Priorities; economic ripple effects and jobs lost was estimated by the Economic Policy Institute. See Methodology for details. Totals may not sum due to independent rounding.
The middle-level estimate shows a loss of $665 million in direct federal dollars coming into the state. If money on this scale is withdrawn from the Florida economy, there would be predictable ripple effects to local businesses and workers. Withdrawal of SNAP funding means a reduction in spending in grocery stores and supermarkets. When families lose health insurance, hospitals and doctors lose income. And some spending would be reduced in other areas as families struggle to pay food and health costs.

The mid-level estimate shows a potential loss of $1.2 billion due to the ripple effects of this lost spending. Further, when businesses have less revenue, they lay off workers. Translating the job loss implied by an economic loss of this magnitude, based on the number of jobs implied per dollar of gross domestic product, Florida stands potentially to lose as many as 8,421 jobs under our middle estimate as a result of this reduction in federal funding coming to the state. The economic impact would vary depending on where the country is in the business cycle. Because these programs serve as an important economic stabilizer, they create a bigger stimulus during an economic downturn and less in a period of high growth.

In addition to this mid-level estimate, Figure 3 includes a simulation for lower and higher levels of disenrollment. At the lower level, with just 15 percent of people receiving benefits disenrolling, the modeled loss of federal dollars to Florida is $399 million, the potential economic ripple effects are $742 million, and the potential job loss is 5,053. At the higher estimate, with 35 percent disenrollment, the loss of federal funds in Florida is $931 million, the potential ripple effects are $1.7 billion, and there could be as many as 11,790 jobs lost.

**Conclusion**

From the beginning, the United States has been a place where immigrants have come to make a new life. In this country, many immigrants and U.S.-born workers alike have climbed from the lowest rungs of the economic ladder into the middle class and beyond. It was the opportunities America provided—and often enough the supports they needed to get started or make it through hard times—that allowed them to succeed. This is the story of the American Dream. And it is the story engraved in poetry on the Statue of Liberty.

The proposed rule sees America’s story differently, as one governed by barriers and fear of newcomers. By suggesting that only immigrants who are already above a certain income threshold are welcome, the proposed rule shows a disturbing lack of faith in our country and the opportunities it provides.
Methodology

1. Estimating the Population that would experience a chilling effect
The Fiscal Policy Institute defines the population that would experience a chilling effect as those who might be nervous and confused by the new rule and might feel like they need to make a choice between applying for needed benefits and avoiding putting their family at risk. As noted in the body of this paper many, and perhaps even most, of the people experiencing a chilling effect are people who will not have to go through a public charge determination.

In order to estimate the size of the population experiencing a chilling effect, the Fiscal Policy Institute uses estimates provided by the Center on Budget and Policy Priorities (CBPP) of the number of people living in families where at least one person is a non-citizen, and where someone in that family has received one of the public benefits named in the proposed public charge rule. The analysis uses the Current Population Survey and corrects for underreporting of SNAP, TANF and SSI receipt in the Census survey using data from the Department of Health and Human Services/Urban Institute Transfer Income Model (TRIM). These TRIM corrections take into account program eligibility rules by immigration status. Three years of data are combined in order to increase sample size and improve the reliability of the estimates: 2013 to 2015, the most recent for which the TRIM-adjusted data are available.

CBPP’s calculations of program participation include the newly considered programs — Medicaid, SNAP, and housing benefits — as well as those already considered — TANF, SSI, and General Assistance. The Census data for Medicaid used by CBPP also include the closely intertwined Children's Health Insurance Program (CHIP). Most participants can be expected to have a very hard time distinguishing between a program funded by Medicaid and one funded by CHIP. The proposed rule does not presently include CHIP, but the notice announcing the proposal explains that the administration is considering including it. Medicare Part D low-income subsidies are included in the proposed rule but were not included in CBPP’s estimates due to a lack of a Census variable that identifies those participants. To model the current public charge benefit related test, CBPP looked at those people who get more than half of their income from TANF, SSI, and General Assistance.

2. Estimating the Economic Loss to Florida
Among the people who experience a chilling effect, some portion would go so far as to disenroll from programs for which they are eligible.

The estimate of the direct loss to Floridians from disenrollment from these programs begins with SNAP, Medicaid and CHIP federal funding data. The estimates use administrative and survey data to approximate the amount of benefits received by families that include a non-citizen. This is the population that due to fear or confusion could forgo benefits even though most of them are themselves not likely to be subject to a public-charge determination. In estimating the economic consequences of the proposed rule, it is assumed that only a portion of this group will actually disenroll from these food, health, housing, or cash supports. While a lot is at stake for people in families with a non-citizen immigrant if they fear running afoul of the public charge rule, there is also a lot at stake in not applying and having your family go hungry or lack health insurance. Again, CHIP is included in these estimates.

The estimates assume a range of 15 to 35 percent of the people experiencing a chilling effect will disenroll from SNAP and Medicaid. The economic effects of the higher and lower disenrollment rates as well as the midpoint of 25 percent are estimated. This follow the Kaiser Family Fund’s paper of February, 2018,
“Proposed Changes to ‘Public Charge’ Policies for Immigrants: Implications for Health Coverage,” which provides a review of the literature leading to this estimate range. The estimates do not attempt to simulate the consequences of adverse selection—for instance, that healthier people may be more likely to withdraw from health care coverage than less healthy people. The 15, 25, and 35 percent disenrollment rates are already a broad range and not a precise prediction.

To estimate the economic ripple effects, the Fiscal Policy Institute uses an analysis provided by Josh Biven of the Economic Policy Institute. The analysis takes the direct benefit loss as calculated above and applies to it an output multiplier for SNAP of 1.6, in line with estimates Bivens summarizes in a 2011 paper. The Medicaid multiplier is 2.0 and is drawn from an analysis of the effects of the American Recovery and Reinvestment Act. After calculating the effect of benefit reductions on output, the output was divided by $146,880 to obtain an estimate of the effect on employment, on a full-time equivalent (FTE) basis. This employment multiplier was obtained by dividing U.S. gross domestic product in 2017 by the number of FTEs in that year.

The economic impact can be expected to vary with the state of the economy. The economic and job loss of the proposed rule will be greater in times of high unemployment, and lower in times of full employment. Since the proposed rule is proposed to be permanent, the effect could be expected to vary.

---

2. The rule gives a family income of below 125 percent of the federal poverty level as a negatively weighing factor, and above 250 percent of the poverty level as a positively weighing factor. Those percentages are translated into dollar figures for different family sizes using the 2018 poverty level. Household income is a Fiscal Policy Institute (New York) analysis of the 2017 American Community Survey 1-year data. Household income includes individuals of varying size including households of just one person.

4. As Attorney General Jeff Sessions put it: “we will prosecute you, and that child will be separated from you as required by law. If you don’t like that, then don’t smuggle children over our border.” See Rafael Carranza and Daniel González, “AG Sessions Vows to Separate Kids from Parents, Prosecute All Illegal Border-Crossers,” The Republic, May 8, 2018.

5. Disturbingly, for those children who do apply for status that requires a public charge designation, the Rule penalizes children by weighing their age negatively. The theory, presumably, is that children do not adequately contribute to the economy.

Uncompensated care funds must also be replenished to make up for losses in emergency care of people without health insurance, but this cost is not included in our analysis of the economic impacts.

The extent of employment impact depends on the state of the overall economy, with a higher impact during times of high overall unemployment, when these programs serve as both a safety net and an automatic economic stabilizer. Since the Rule would be a permanent measure, there would be periods in the economic cycle the predicted economic impact would be higher and when it would be lower.

The analysis of direct loss to Florida was performed by Danilo Trisi of the Center on Budget and Policy Priorities, and the analysis of economic ripple effects was performed by Josh Bivens of the Economic Policy Institute. See Methodology section for more details.

Any slowdown in the growth of aggregate demand caused by reductions in spending on these programs could in theory be neutralized by the Federal Reserve Bank lowering rates to spur growth. However, this does not change the size of the fiscal drag that benefit cuts would impose on the economy. These estimates are implicitly a measure of how much harder other macroeconomic policy tools would have to work to neutralize the demand drag stemming these cuts. Further, it is deeply uncertain whether other tools of macroeconomic policy have the ability to neutralize negative fiscal shocks. See Gabriel Chodorow-Reich, Laura Feiveson, Zachary Liscow, and William Gui Woolston, “Does State Fiscal Relief During Recessions Increase Employment?” American Economic Journal: Economic Policy, August 2012, pp. 118-145.

Data for the analysis come from tables 1.1.5 and 6.5 from the National Income and Product Accounts of the Bureau of Economic Analysis. The quotient was increased by the growth in its nominal value in 2017 to forecast what it would be in 2018.
