

Oversell Protection

Overbook with confidence, protecting both passengers and profits

Problem

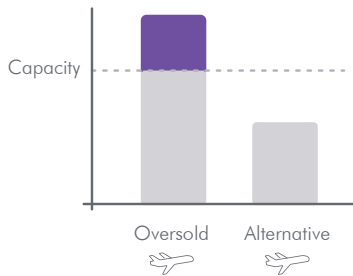

In uncertain times, airlines must have the flexibility to overbook flights, but the current resolution processes are inefficient

Solution

Overbook flights safely, efficiently and confidently by fully automating the flight resolution process

How it works

1

Detect situation

Volantio's Yana platform automatically detects flights where the booked capacity is greater than the physical capacity of the aircraft, and suitable alternatives with available capacity

2

Solicit volunteers

Yana automatically solicits and prioritizes volunteers willing to rebook. Volantio's proprietary machine learning system, GreenLeaf, chooses the optimal compensation amounts and specific flight alternatives

3

Rebook passengers

Yana automatically rebooks volunteers onto alternative flights and processes compensation, until the oversold flight is resolved. Data is fed back to GreenLeaf enabling continuous optimization

Why it's valuable?

Stress Free & Cost Effective

Yana is fully automated and self optimizing, eliminating stress and costs on call centers, front-line staff and customers

Overbook settings

Off Min Max

Profit Optimal

In times of volatile demand and constrained capacity, oversell protection lets airlines continue to overbook confidently by de-risking the resolution process

Versatile & Adaptive

Yana, powered by GreenLeaf, adapts in real time as the number of needed seats changes, adjusting offer amounts and flight alternatives to maximize success
