

Dimaps Orchestra is ready to work in concert with your current logistics systems so your company can perform at the highest level.

We are **Dimaps**, a software company from Denmark with expertise in precision distribution and navigation. Last year, our local knowledge software guided more than **1.4 billion on-time deliveries** throughout Europe.

The Problem: Logistics information silos prevent the flow of data needed for consistently precise deliveries. These disconnected information silos put your business at risk with outcomes that include poor customer service, missed deliveries and lost business.

Our Solution: Dimaps Orchestra is an open, intelligent data platform that bridges information silos across your business. Orchestra streamlines your current logistics systems by importing live and historical delivery data via event-driven communication to create a global view of your business. Our cloud-based software modules are easy to add on to your existing infrastructure to deliver immediate benefits.

Mapping the Future of Delivery: Dimaps is at the heart of emerging delivery technologies. Dimaps GIS expertise is assisting with driverless van development. Our engineers are also working with the National Drone Centre in Denmark developing FAA-approved flight plans for deliveries by drone in remote and rural areas. Dimaps continues to explore new opportunities that map the future of delivery technology.
