

NEW When a stacking door
turns into a curtain wall

Stacking Door **SPACELITE HT 40 Vision** with real glass

In many buildings industrial doors form an architectural foreign body. The new **SPACELITE HT40 Vision** however features the visual design of a glazed curtain wall. With real glass and aluminium profiles you apply the same materials, allowing for a sophisticated architectural solution. The function as an industrial door remains, with its beneficial opening technology in the reknown Butzbach quality.

Function and design brought to perfection

- Curtain wall design without vertical inter-spacer up to 3.6 m door width (with inter-spacer up to 5.0 m width)
- Insulation glass with twin-walled tempered safety glass with excellent thermal insulation values for sustainable building: $U_g = 1.1 \text{ W/m}^2\text{K}$
- Advantages compared to acrylic glass: No scratches and cleaning traces, no fogging, condensation or dirt between the panes, no optical deformation of the panes

The benefits of the stacking door technology

- Minimised required space
- No fixation by the ceiling required, easy integration also in glass façades
- Reduced cost of operation and maintenance, as wearing parts such as torsion springs, hinges, spiral cables or shock absorbers are NOT used
- Combination with door elements with translucent fibre glass possible

Upon opening, the door panels stack safely and compactly behind the lintel where they are protected. Lighting devices, lifting platforms and other fittings on the ceiling are not impaired.
