FIRST RAPID SHUTDOWN INVERSION SYSTEM COMPLIANT WITH RULE 21 PHASE-3 CERTIFICATION

Greetings!

On Christmas Eve, the California Public Utilities Commission granted a request for the Phase 3 requirements of Rule 21 to be extended another two months, to March 22nd. This was to 'avoid market disruption,' since the major manufacturers of inverters were not yet in compliance. There was one company, though, that already was CSIP (Common Smart Inverter Profile) certified. The one company made entirely in the USA. The one company that produces the most powerful inverter on the market based on Silicon Carbide technology. The one company that's been experiencing explosive growth- and is forecast to triple that expansion in 2020. The one company that's fully prepared and ready to tackle the future: Chilicon Power.

CSIP Certified Products

2020 CP-720 MODEL

With the new year comes new changes. Not only does Chilicon Power manufacture the only inverter to be CSIP certified, the company's excited to unveil the latest version of its groundbreaking CP-720, the highest per module wattage in solar. The improved 2020 model has integrated AC and DC cabling. This modification allows for quicker installs and a simpler ordering process. Quick and simple, that's the Chilicon way.
