

BEST COMM IN SOLAR, HANDS DOWN

Chilicon Power has perfected module level power communication. The extremely robust PLC enables the Gateway, Chilicon's industry leading monitoring system, to communicate seamlessly with microinverters from distances of well over 500 feet. Along with a graphically rich, 7 inch touch screen, the Gateway offers such features as home security, consumption monitoring, and zero net export (and plenty more). It's an all-in-one smart home hub, a must-have for anyone considering solar.

TDMA MODE = NO INTERFERENCE

With Chilicon's CP-100 Gateway Time Division Multiple Access (TDMA) mode, you can use multiple Gateways on side by side structures, whether they're a string of single family homes, condos, or office buildings. Chilicon Power's proprietary TDMA mode allows the Gateways to be scheduled so as to avoid interference without the addition of costly line communication filters to isolate arrays for separate monitoring. Just another way Chilicon is making solar commissioning easier.
