CP-720: THE MOST POWERFUL PER MODULE INVERTER IN SOLAR

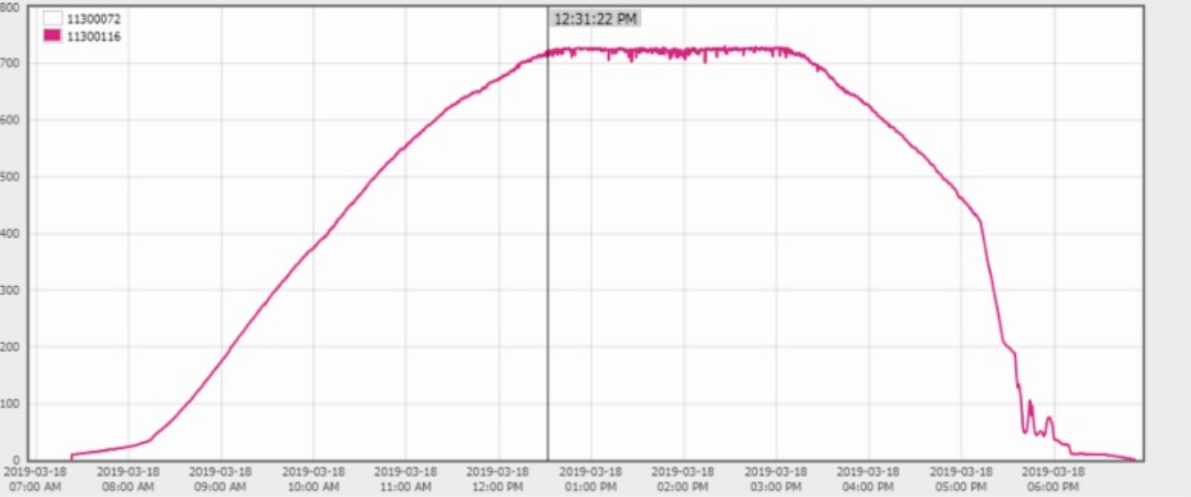

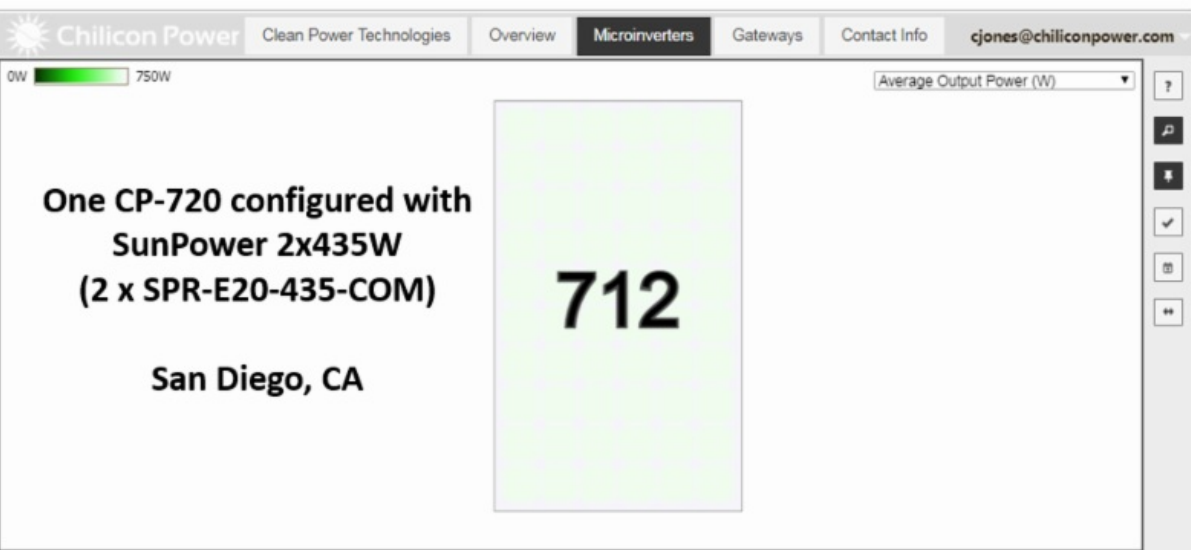

Over the past decade, Chilicon Power has been manufacturing the world's most advanced microinverter system. Recently, the California-based company raised the bar even higher with its new 720 watt twin inverter. Since its launching in November, the CP-720 has been performing exceptionally well in the field. A twin inverter, it pumps out an impressive 720 watts of power- 360 per module. That's about 25% more output than competing microinverters. What's more, the CP-720 is extremely versatile. It's compatible with any module on the market, including 96 and 128 cell. And the best part is the price: the entire microinverter system, with modular cabling and superior monitoring, is under 30 cents a watt for most installs.

So why not try Chilicon Power? We think you'll be extremely pleased.
