By Gilbert VandenHeuvel

This week we have been busy building stainless 16 foot feed troughs.

Welding and bending stainless is a daily routine for us but for most it is an interesting activity to see.

To see a video on how we bend the feed trough you see here [CLICK HERE.](#)

After they are bent, two pieces need to be welded together to make it long enough, ends are welded on to keep the liquid feed contained and supports are welded on to strengthen the trough.

To see the welding process video via time-lapse [billwatch](#) photography [CLICK HERE](#).

Thanks Natt for playing along so we can get some video.
