

Our superior 5 Zone UltraCoil pocket spring system has up to 4 times more support springs compared to a conventional pocket spring bed. The higher spring count improves weight distribution over the entire mattress to offer longer lasting support while reducing motion transfer and pressure points that will help extend delta sleep periods.

The unequal zoning is purposely done so that our beds will offer any body type exceptional spinal alignment and comfort. The larger reinforced centre falls under the heavier part of the body for better lower back support while the medium sections by the shoulders help prevent excessive pressure. The top and bottom (head and foot) section is reinforced to strengthen the seating edges.

MORE SPRINGS = MORE SUPPORT

- Up to 4 times more springs compared to a conventional pocket spring systems.
- Offers improved weight distribution and longer lasting support.
- Reduces motion transfer and pressure points to extend delta sleep period
