

Build critical applications 50% faster.

De-identifying data in-house is a slow, painful process that eats into development time. All too often, the data is damaged and loses utility for development and testing, worsening bottlenecks.

Tonic makes it easy to get realistic data to developers fast, while baking in security to ensure the data is compliant and safe from re-identification.

Eliminate hours of de-identification work

Automatically apply generators to every column in your database to model your data without writing a single line of code.

Preserve complexity

Link related columns to preserve critical relationships in your data and maintain consistency, even with JSON data.

Get only the data you need

Scale large, complex data down to a size that is manageable, useful, and easier to test with using our built-in subsetter.

Ensure privacy

Apply differential privacy to transform data securely with built-in mathematical guarantees against re-identification.

Tonic is the fastest path to high-quality, compliant data for teams of any size, integrating seamlessly into your workflows with API automation.

“Tonic has an intuitive, powerful platform for generating realistic, safe data for development and testing. Tonic has helped eBay streamline the very challenging problem of representing the complexities contained within Petabytes of data distributed across many environments.”

– Senthil Padmanabhan
VP of Engineering, eBay

- Eliminated the need for a custom data infrastructure
- Significantly improved security posture

“I’ve tried other tools in the past, but they were hard to use, my engineering teams hated them, and in the end, they never quite met all our needs. Tonic gives Flexport the flexibility to satisfy all our use cases in a tool our developers love.”

–Kevin Paige
CISO, Flexport

- 100% of developers across dozens of teams now working with protected data
- Transformed data governance strategies enabling Security and Engineering to work together with ease
