

Powering Secure Messages for the Financial Industry

Symphony is a cloud-based messaging and collaboration platform that securely connects markets, organizations and individuals for the financial industry. Symphony currently has over 510,000 users from more than 340 companies worldwide, powering over 60 million monthly messages.

PROBLEM

Symphony had made an acquisition to support identity management for their application. They approached Admios for help **integrating the solution from the acquired company into the Symphony code base.**

APPROACH

Admios worked with the product owner and engineering team lead to spin up a team of 4 developers: 2 FE and 2 BE. During the 11 month engagement, Admios built 2 factor authentication, a chat app, notification system, and helped with QA. The team worked in Backbone, JS, and React.

RESULTS

By seamlessly integrating the identity management application into the code base, Symphony gained new functionality meeting in demand customer feature requests.

They also gained new security features further establishing their differentiator in the financial services industry.
