Focused & goal-oriented event monitoring

/// Problem

Current implementation: manual monitoring of any event in person or via surveilling video streams.

- Expensive because focused on high temporal and location-coverage
- Inefficient and ineffective detection: many events are overlooked, a lot of video material is not even looked at
- Current setup: security staff and administrators controlling the law & regulations to avoid charges

/// Benefits

- Focusing the existing staff's actions on relevant events leads to higher effectiveness and efficiency**
- No need for additional infrastructure:** You can utilize the already existing cameras and LCDs. If these are not present, you will only need two cameras and an LCD
- 24/7 monitoring:** our system will monitor your premises at all times

/// Solution

Real-time highlighting of monitored events relevant to you with the highest privacy possible.

- Highlighting & pop up of relevant events on mobile and in control room
- Detection of events directly at the camera
- On-camera face anonymization Notification to administrator
- Real-time API for integration with other systems

/// What you get?

- Software
- Hardware (LCD, processor, camera)
- Over-the-air software updates
- Installation (by NATIX reps)
- Technical after-sales support
- SMS Alert
