

# JSR CONSTRUCTION

## SERVICES

## STEEL FRAMED BUILDING AND CLADDING

JSR are able to provide steelwork building and cladding services for a range of applications from industrial facilities, to agricultural barns, and office buildings.

Steel framed buildings form a vital part in the functionality of most industrial or agricultural companies. JSR has the proven capability to supply and build large scale structures. Ahead of mobilising on site, JSR will work directly with the client to ensure the design requirements suit the needs of their end user requirements.

JSR successfully delivered one of our largest projects for client, Heat Treat 2000. The supply and build of the Heat Treat 2000's new industrial building was a project that required JSR Construction to use a range of services and expertise to complete the project over a nine month period.

For more information on the works we are capable of delivering on steel framed buildings, contact us to discuss your project details.
