

## SERVICES

# CONCRETE FLOORING

**JSR Construction are experts in concrete flooring services, delivering high quality, professional and durable surfaces across the built environment.**

The work process includes the installation of a cast concrete slab, laying of meshed reinforcement, pumping the concrete in place and a perimeter isolation joint installed in order to ensure the concrete flooring does not crack.

JSR offer a number of different laser screeding options to suit the individual project, this ensures the newly laid concrete with a level finish. In addition to this, we carry out power floating services on all concrete flooring projects to provide a durable surface suitable for heavy wear.

Just one example of where JSR has utilised our industry expertise to install a concrete floor was at Darlaston Builders Merchants. The JSR team worked closely alongside a structural engineer in order to modify the slab, improving the design effectiveness.

Through continual investment in the best equipment and staff training, JSR ensures a professional finish achieved on every project. We have been delivering high quality concrete floors across the country for a number of years, applying the same high standards regardless of location or specification.
