

What is XYX?

XYX (also known as Burn Yield Burn) is an Ethereum based protocol that diminishes and self-distributes. All addresses holding XYX will receive the distribution of XYX to their wallets simply by holding and does not require additional claiming.

The idea of having a token supply that both diminishes its circulating supply in addition to reward holders is aimed at creating a more stable store of value. There will be less and less tokens in circulation over time, increasing the demand of the token while also maintaining a healthy redistribution metric.

Burn & Redistributon Percentages

A total of 3% of all transactions will have the XYX protocol applied to them, 1.5% of the transaction being burned, 1.5% being redistributed to holders. Having equal parts of the burn and redistribution is a fair way to reward holders while also reinforce the stability of the price. Keep in mind “transactions” do not simply mean only “buy” and “sell”, even sending XYX tokens to another wallet will also trigger the protocol to take effect.

Why do we need XYX?

Before redistribution token mechanics, digital assets required participation such as mining, staking or lending in order to participate in receiving any sort of redistribution, which raised the bar in who all could participate.

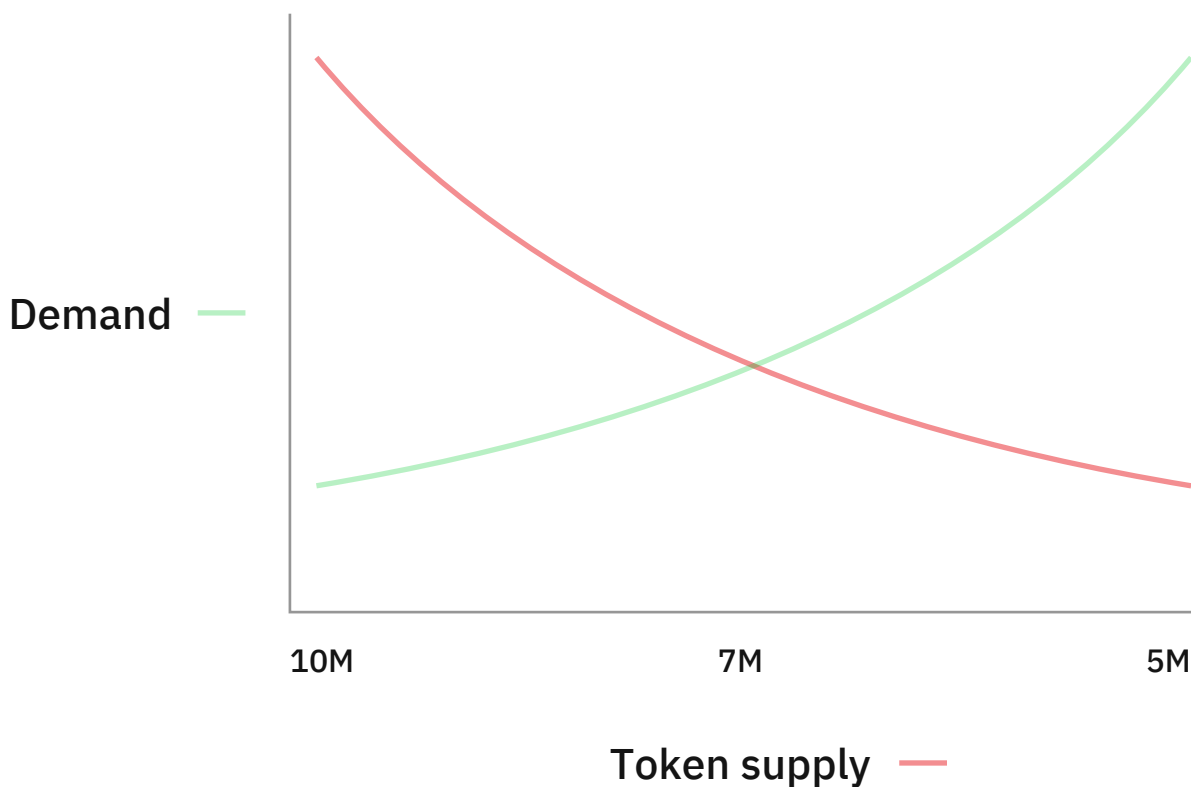

XYX relies solely on the Ethereum network to operate, so no mining or staking is required (although depending on adoption, staking in the future could be a possibility).

Having a stable store of value is a difficult task to pull off in the DeFi space, but our hope is over time with decreased circulating supply and increased demand - XYX can function as a stable store of value.

Launch & Token Metrics

When XYX launched there was a total supply of 10 million tokens, 96% of which (9.6M) were added to the Uniswap liquidity pool and liquidity locked for a year - with the remaining 4% (400k) tokens to be used for marketing, development and community efforts. The token was stealth launched (no pre sell, no fundraiser) on Feb. 6, 2021, and has already burned roughly 4.5% of the total supply since launch.

How is XYX a community protocol?

While there is a small team of individuals who brought XYX to life, there is no team wallet or unfair token allocation or holding. The direction and progression of the growth and adoption of XYX will be solely influenced and dictated by the community through votes and action taking. The only people who will gain from the continued success and traction of XYX are the token holders themselves, which we believe to be fair and transparent.
