Intelligent Healthcare

Lighting Up New Pathways for Smart Population Healthcare Management

Nanox.AI goes beyond its commitment to save lives in acute settings, to advancing value-based population healthcare management on a large scale, pioneering tomorrow's medical imaging AI.

AdjustifAI Coding Solution

AN OUNCE OF PREVENTION...

People suffer from a range of chronic, progressive conditions. Health systems and plans participating in value-based care depend heavily upon the accurate representation of these conditions across their patient populations through the proper coding and submission of medical claims. AdjustifAI is all about finding patients with unknown chronic conditions, getting them engaged in preventative care, and enabling a simple and reliable coding process.

Early or predictive signs of such conditions appear on CT scans acquired regularly on millions of patients every year for a myriad of reasons.

Our solutions focus on detecting commonly overlooked signs of the most prevalent conditions in these imaging studies – without physicians having to order any extra scans or exposing patients to further radiation.

HOW IT WORKS

AdjustifAI analyzes large batches of chest and abdomen CTs, highlighting previously undiagnosed signs of chronic conditions.

These improved clinical insights equip primary care physicians with an additional tool to help identify patients suffering from such conditions.

Once patient records are updated with the corresponding HCC diagnosis code, value-based reimbursements and risk-adjusted payments are calculated more accurately.

Physicians obtain the resources they need to place their patients on the right preventative care pathways sooner.

WHO BENEFITS AND WHY

Patients – whose long term health prospects and quality of life are significantly improved.

Payers and Integrated Health Systems – who optimize risk adjustment for Medicare Advantage/ACO and increase PMPM revenue.

The Healthcare System as a whole – serving more patients while saving on the cost of managing these diseases.

AN AI INDUSTRY FIRST

In an unprecedented decision by the American Medical Association, Nanox.AI's Bone Health Solution for the detection of VCF - FDA cleared and CE Marked - has been granted a specific CPT III code*. This is a milestone and potentially a game changer in the long term management of osteoporosis in large populations, and is one of many chronic conditions that AdjustifAI is designed to detect.

We at Nanox.AI will continue to develop this and other solutions for a range of chronic diseases affecting large populations.

And this is just the start.

*The CPT is named "Cat III-Assistive Augmented Intelligence Analysis," and defined as "Accepted addition of code 0X36T to report an automated analysis of an existing computed tomography study for vertebral fractures." Effective January 1, 2022.

AdjustifAI Coding as a Service - The Flow

PROPER REVENUE ADJUSTMENT IN CAPITATED OR VALUE-BASED SYSTEMS

Nanox.AI integrates seamlessly with any PACS system, and can be installed on the cloud or on-premises.

FDA cleared and CE Marked

Version: 4.61.14, October 26, 2021
