

# Tip #4

| Use of  
\_setSelected() API

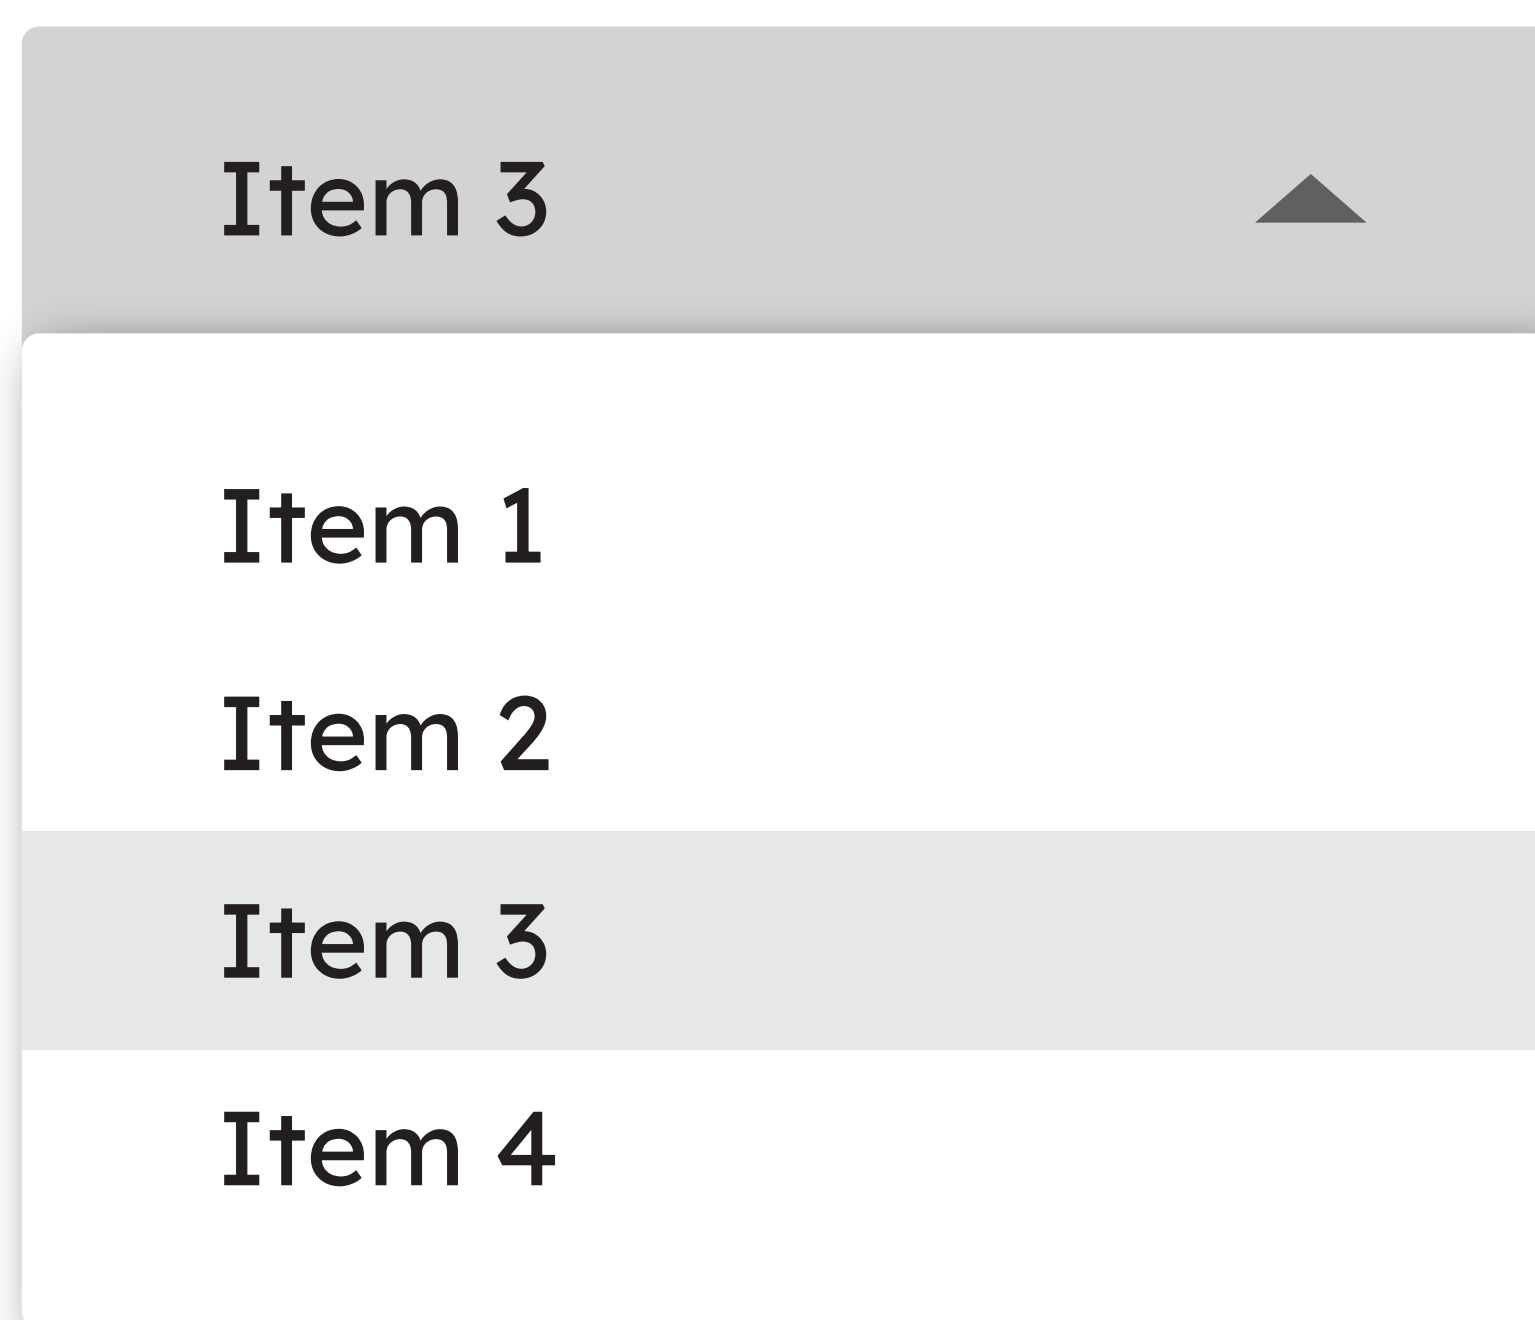

*Swipe next >*

# Where it is Used?

---

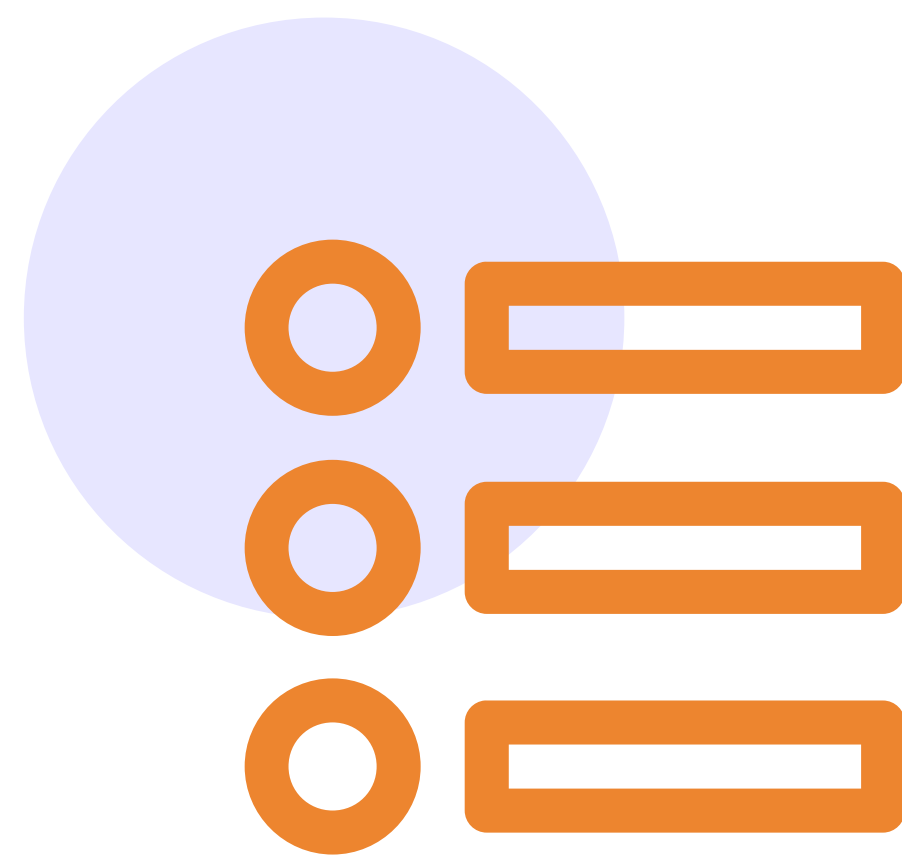

This API facilitates the selection of **drop-down option(s)**.

# How to Use this API?

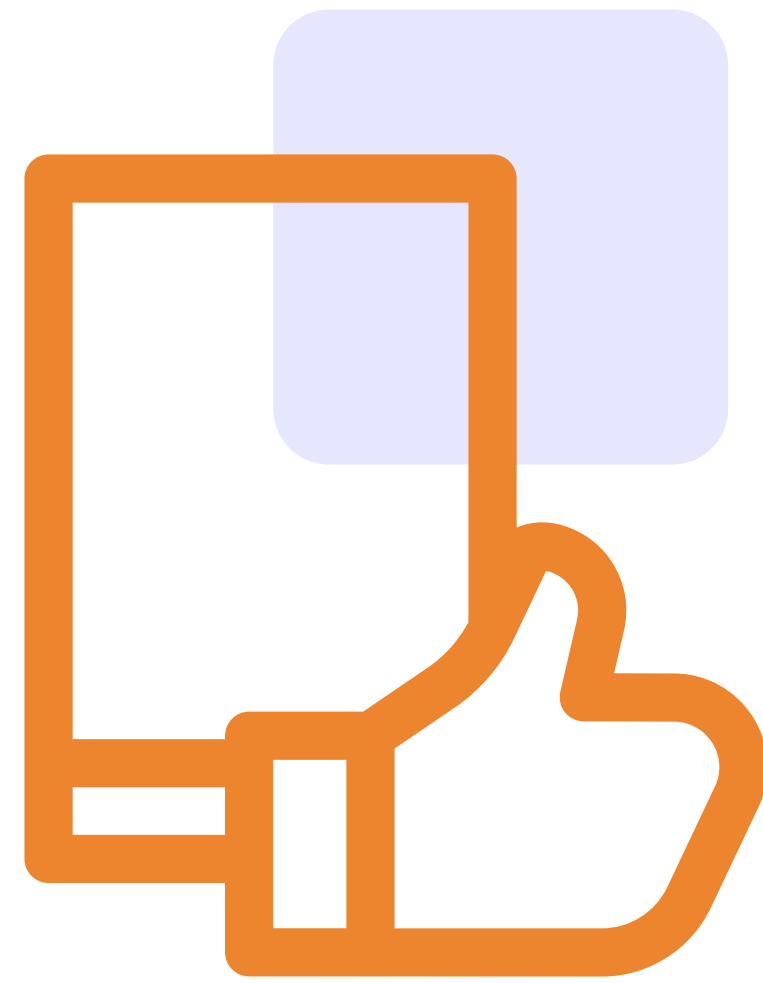

---

If the element is recognized using `_select()` for the select drop-down, employ the `_setSelected()` API to choose one or multiple options.

sahi code

```
_setSelected(_select("fruitSelect"), "Apple");  
_setSelected(_select("fruitSelect"), ["Apple", "Banana"]);
```

For elements identified with `_div()`, `_span()`, `_listItem()`, etc., **utilize the `_click()` API.**

sahi code

```
_click(_div("Class")); //clicking on the dropdown element
```

```
_click(_listItem("Account")); //dropdown option identified as listitem element
```

```
_click(_span("Account")); //dropdown option identified as span element
```

```
_click(_div("Account")); //dropdown option identified as div element
```
