

# Tip #8

Prefer  
Conditional Waits  
over Implicit Waits

*Swipe next >*

# How to use this Tip?

**Sahi Pro automatically waits for page loads and ajax activity.**

Consequently, there is no need for adding wait statements in most cases

However, **in rare cases** (e.g Page has loaded but all elements are not rendered) where wait is required, **a conditional wait can be used.**

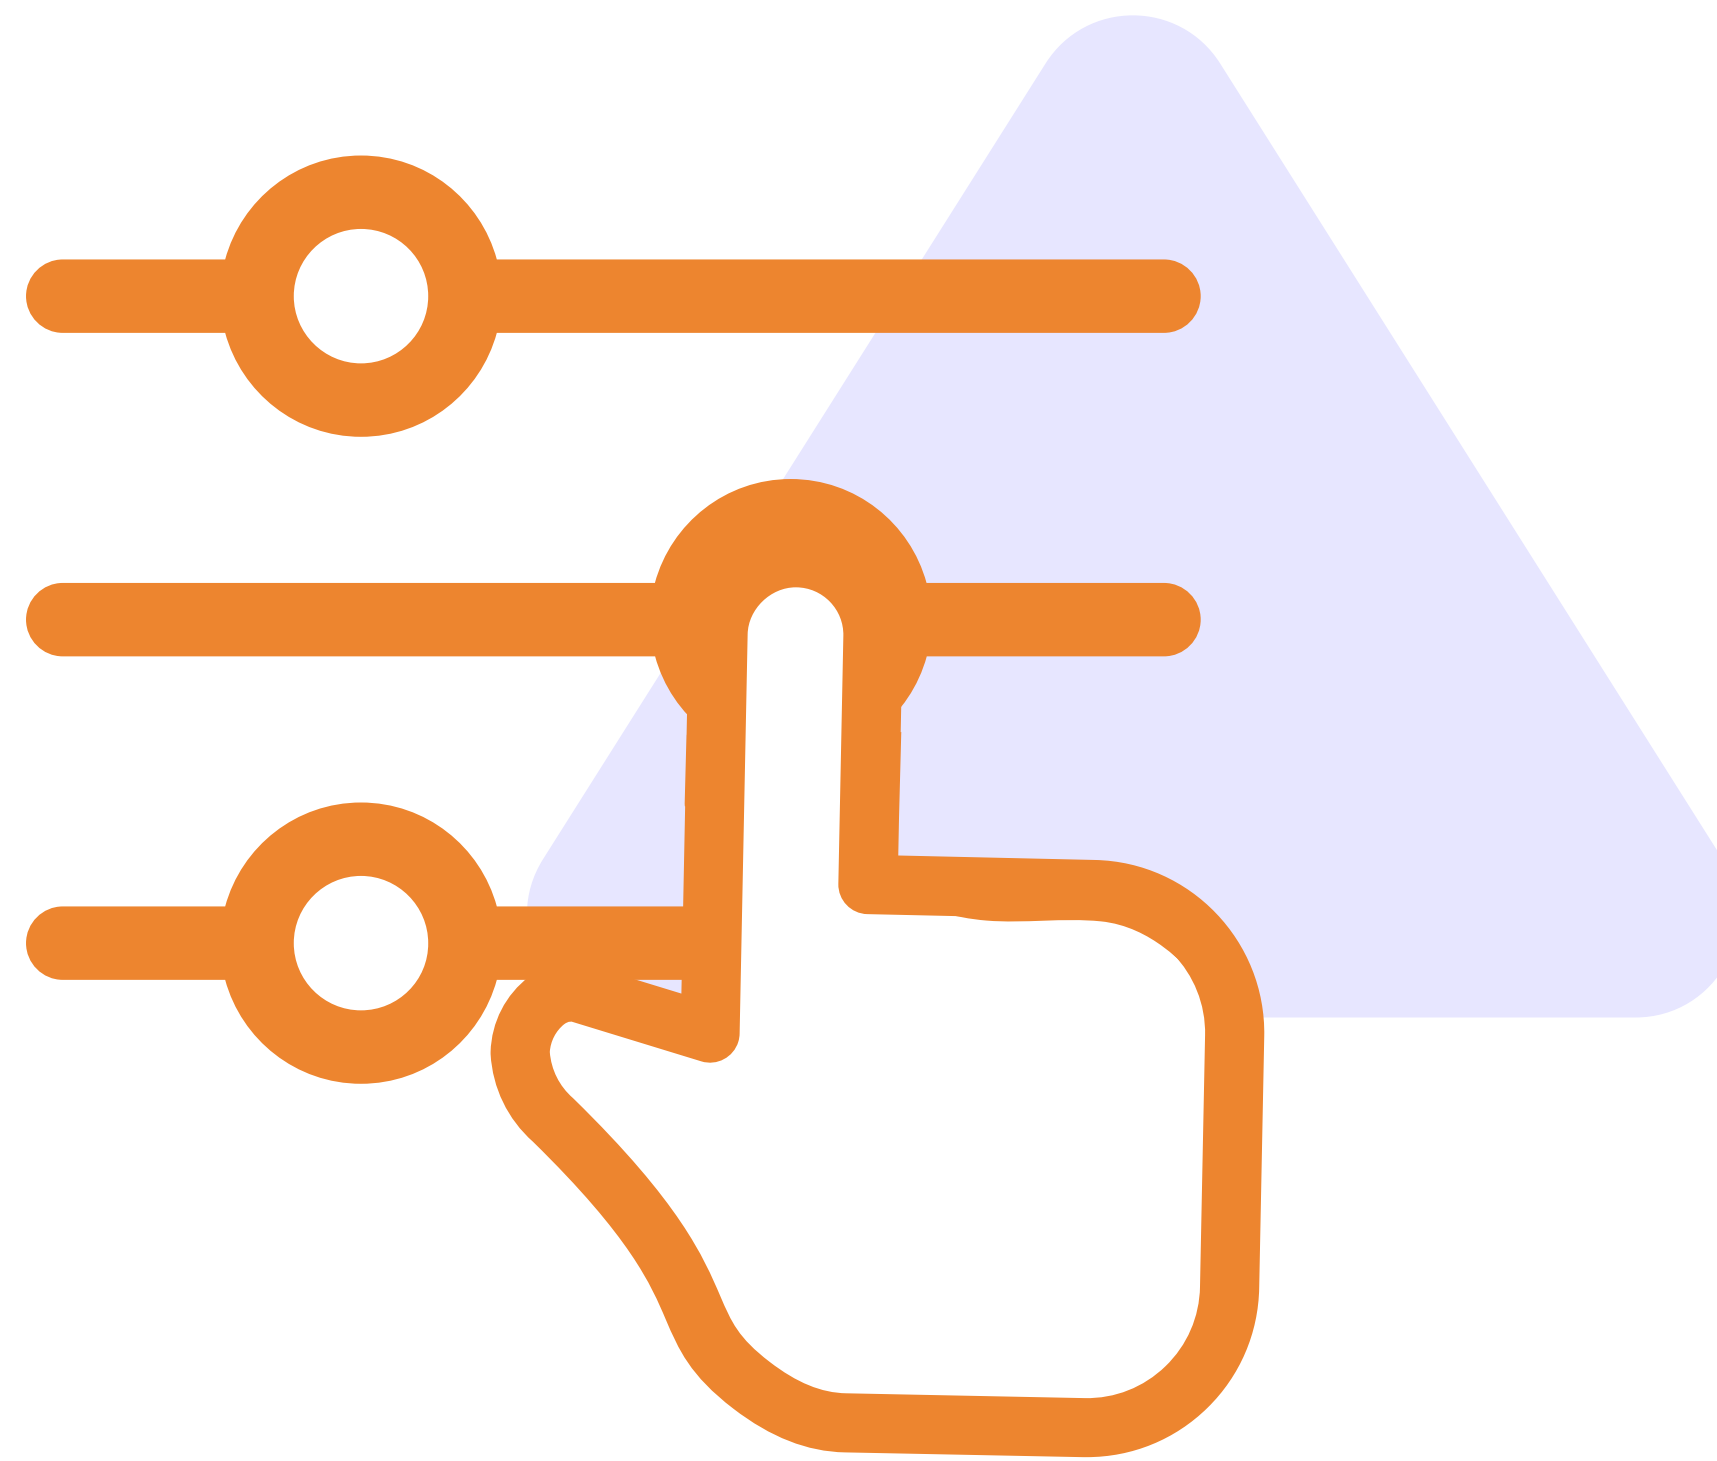

## Example:

Use below step to **wait till** the **Confirm button becomes visible** or **3 seconds maximum**.

sahi code

```
_wait(3000, _isVisible(_button("Confirm")));
```

# How does this help you?

Providing a specific condition for wait, ensures that the Playback waits only till the condition is met. Thus, **conditional wait facilitates more control over the waiting time.**
