

Application and Product Security Challenges

You cannot secure what you cannot see.. 95% of the organizations cannot tell how many applications, APIs, and microservices are in their environment.

Tremendous business value is trapped because antiquated processes and workflows wear down AppSec engineers and developers.

Twice or Once-a-year compliance is no longer sufficient as releases are done on a weekly or even daily cadence.

ArmorCode platform demonstrates value in 15 minutes or less because it built from ground up to tackle complex challenges with a very simple architecture.

Application Security Posture Management

- Centralizes all findings and remediations from AppSec tools, including SAST, DAST, SCA, Bug Bounty, Pen Testing, and more.
- Normalizes, de-dupes, correlates, and prioritizes the findings based on organizational policies and application value.
- Maintains a “system of record” for all applications and the security findings, providing a single source of truth for AppSec control activity.
- Provides point in time and trend analysis of security

DevSecOps Orchestration

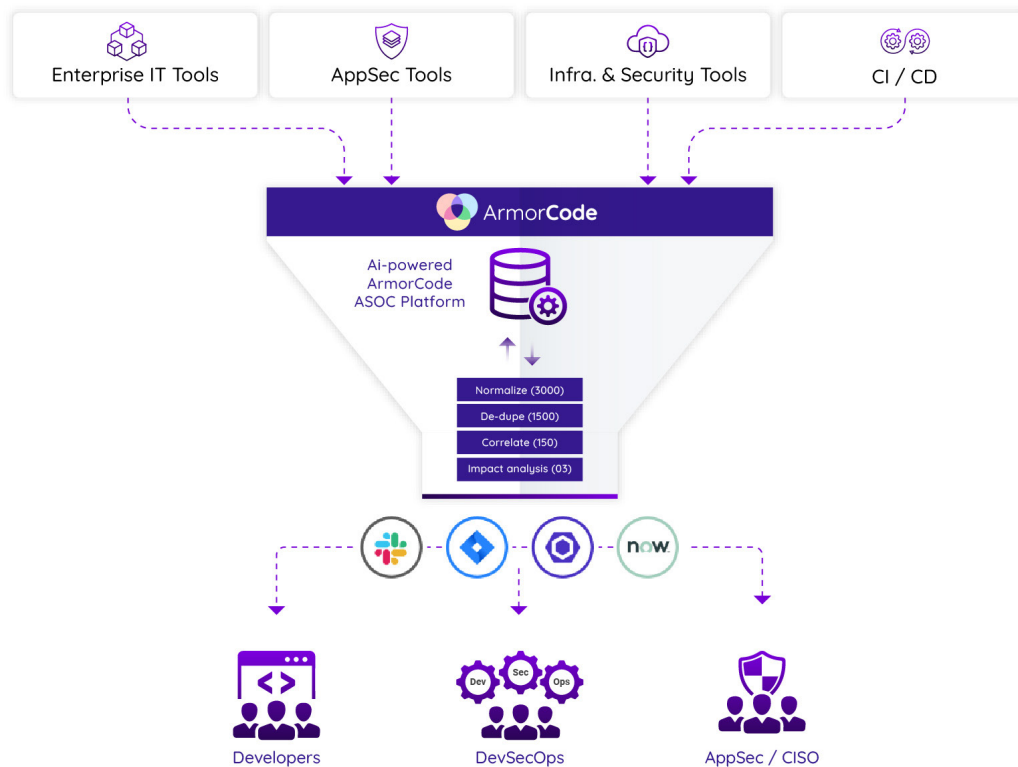

- Integrates and automates the intersection of AppSec tools and the DevOps SDLC.
- Maintains a Knowledge Base (KB) of security research that is specific to the policies and priorities of the organization.
- Connects unknown repositories to the required AppSec tools in real-time
- Generates audit trail and reporting of security findings and disposition

Continuous Compliance

- Includes native support for key standards including SOC2, GDPR, FedRAMP, HIPAA and OWASP Top 10.
- Software releases have gone from yearly to monthly, weekly and daily and this module continuously evaluates application security posture against these control standards, and identifies exceptions in real-time.
- Facilitates on demand reporting to satisfy periodic audits.
- Generates point-in-time compliance and real time notification of compliance exceptions

Application development has changed radically: from waterfall to agile development and from monolithic application architecture to microservices delivered at the edge. Once-a-year compliance is no longer sufficient as releases are done on a weekly or even daily cadence. However, application security and compliance tools haven't kept up,” said Teza Mukkavilli, Chief Security Officer at ChargePoint, an ArmorCode customer. “My team was able to onboard the ArmorCode platform in less than 15 minutes and saw tremendous time to value.

30 to 60% Reduction in cost of fixing issues	40% Reduction in triaging time	450% Return on investment
