

**Associated Product Manager | Location: Bangalore**

**Position Summary:**

Responsible for creating and leading the product vision and strategy for a set of products. You will lead and manage the execution for development and deployment of a set of features, including planning and prioritization, creating development specifications, test cases, test data, UX/UI sketches, process flows, underlying business entities design specs for new products as well as key enhancements to existing products.

SemiCab's approach to solving freight industry's biggest problems is packed with challenging problems involving complex algorithms, huge amounts of data and exciting opportunities for impacting conventional business workflows. You will be working across multiple teams to expeditiously build products and features to optimize how our freight platform works. You will be working in a fast-paced start-up environment where initiative, analytical skills, teamwork, and urgency of purpose will be rewarded. In the process, you will be disrupting the logistics industry with us.

**Responsibilities**

- Develop and maintain a clear and prioritized 1-2 years roadmap accounting for the immediate needs, known future requirements and the ultimate corporate vision.
- Develop and keep updated documentation on features, development specifications, business entity definitions, business workflow, UX/UI design, test cases, and test data to meet business needs.
- Prioritize and support development of the product and major features, aligned with the strategic business direction and current priorities.
- Write and maintain strategic documents to define business requirements for new and enhancements to existing solutions.
- Make smart trade-offs (time vs. effort vs. features) for most efficient use of resources and meeting business objectives.
- Present regular progress on product planning and development efforts, including annual long-range plans.
- Create product collateral for user training, and standard operating process documentation as needed.
- Work closely with development, QA, executive, and other teams to create a harmonized and productive environment to achieve optimal business success.
- Support customer support and product deployment teams as needed.

**Qualification and Requirements**

- 5+ years of experience in supply chain software product design and development. Familiarity with road transportation in the US is highly preferred.
- Bachelor's degree in Industrial Engineering, Business Administration, Operations Research, Management Science, or a closely related field of study. Master's in logistics or supply chain is preferred.
- Strong knowledge of business object and data modeling, API integrations, analytics, and data management.
- Excellent written and verbal communication skills and previous experience in writing functional product specifications.
- Prior experience managing technical products that typically leverage AI/ML and optimization techniques to solve big network optimization problems.
- Basic knowledge of SQL, scripting languages, and data analysis tools is highly desirable.
- Work experience to provide architectural guidance and direction.
- Competitive research to continuously evaluate and build platform capabilities that are best in class.
