

Dear Partner,

The USA Federal Communications Commission has implemented rules for USA terminating traffic that apply differently to carriers depending on their status.

- If you are a licensed USA carrier you must register in the FCC database by 30th June 2021 and certify that you have implemented a strategy to prevent illegal spam, phishing and robocalls.
- If you are a non-USA carrier with USA terminating traffic that has a non-USA originating number, then there is no impact.
- If you are a non-USA carrier with USA terminating traffic with a USA originating number, then you must register and certify in the FCC database prior to 30th June 2021. As of 28th September 2021, this traffic will be illegal and blocked if you are not registered. The most common legal cause for this would be USA roaming numbers.

PTGI will be registered and certified prior to 30th June 2021 as dictated by the FCC.

To secure your USA retail traffic on a direct high-quality route select PTGI as your vendor of choice.

PTGI interconnects with major US operators and routes voice traffic to all 145,000+ NPA-NXX codes in the USA. We employ both LNP dipping and LRN capabilities to ensure that voice calls get to the termination point faster and more directly. This saves money for our customers and provides for a better end user experience.

Between 30th June 2021 and 28th September 2021, PTGI-ICS will begin checking the FCC database for all originating carriers that are sending USA traffic. Any carriers who are sending USA terminating traffic with USA originating numbers and are not registered in the FCC database, will be blocked for that traffic at that time.

Additionally, PTGI currently accepts USA terminating traffic that includes a STIR/SHAKEN token in the SIP header and will pass this token to the terminating network.

Please do not hesitate to call your PTGI Sales Representative with any questions regarding our US Domestic Voice Termination product.

Thank you for your business.
