

SECURITY CONTROL SYSTEMS FOR THE CORRECTIONS INDUSTRY

- ▶ 25 Years in the Industry
- ▶ Each system 100% factory tested prior to shipment.
- ▶ Administrative and Configuration Software
- ▶ Interactive Documentation Software
- ▶ Touchscreen Control Software
- ▶ Graphic Control Panels
- ▶ Programmable Logic Controllers
- ▶ Industrial Grade Termination Boards
- ▶ System Upgrades
- ▶ Built to UL508A Standard
- ▶ Engineered for quality, standardization, durability, and maintainability.

INVESTIGATE SECURED STATE

"During more than a decade of providing design services from initial concept to post-occupancy evaluation, I have worked with hundreds of firms that provide products or services to the AEC industry. Creative Technologies has exceeded all of my expectations, provided a higher standard of care on a consistent and ongoing basis, and made me look better than any other firm with whom I work."

— Hugh D. Lester, Consultant

Creative Technologies has been manufacturing electronic security control systems for over 20 years. Recently, we branded our systems "Secured State". Secured State's systems are built using common sense principles designed for reliability and maintainability. System engineering is accomplished using Secured State's Right from the Start software collaboration tools. Software is developed using standard software development products. Computers use Intel® architecture for reliability and continuous operation. Omron, a multi-billion dollar, global organization, provides our Programmable Logic Controllers.

TOUCHSCREEN EQUIPPED CONTROL CENTER

Our equipment racks are assembled and wired to the demanding standards and requirements of UL 508A. Prior to shipping, all systems are fully assembled, connected, and 100% tested. All of these factors equate to the highest level of standardization, consistency, and quality in the industry.

One of our major strengths is our background in electrical contracting. Through many years of hands-on experience, with all types of electrical equipment, we have learned what makes equipment easy to install and maintain.

While many in the corrections industry have opted for miniaturization, compactness, and lighter materials (at the expense of installation and maintainability) — we have not. We build systems that can withstand the strong-armed electrician during installation and provide plenty of space for the maintenance person in years to come.

MODULAR SYSTEM COMPONENTS

Our hardware is modular, easy to troubleshoot, and built for sustainability. However, the best-

built system is of little value without logical, concise documentation to install and maintain it. This is where we stand above others in our industry that provide inadequate documentation or sometimes no documentation at all. We have always built simple, reliable, and well-documented systems that can be maintained by the end-user. Our interactive documentation software takes this commitment one step further, providing a simple means for system and device maintenance. With this tool the user can navigate system documentation by "clicking" a field device symbol on a floor plan graphic with a mouse. What could be simpler or faster?

Creative Technologies is committed to building the finest systems in the industry with the documentation to support them.
