Managed Service Platform

The multitenant Managed Service Platform of FileCap will definitely add value to the portfolio of a Managed Service Provider (MSP). In combination with the FileCap partner program, this platform allows you to easily provide your customers with a Managed File Transfer solution and a secure email service hosted on your own web server environment.

Simple license management

- Create or terminate a FileCap portal any time you want
- Set quotas per MSP Portal
- Create test licenses
- Migrate test license to an official license
- Choose midterm upgrades of licenses

## Managed Service Dashboard

- Simple dashboard to manage your customers
- Notification when portal exceeds set quota
- Schedule your updates

Private hosted

The FileCap Managed Service Platform can be placed in your own data center or, at the requested of the customer, on premise of the customer. This way, you and your customer always know where the data is.

Secure

Advanced encryption methods (256-bit AES) secure each individual file on a shared storage. Each up- and download is protected. This encryption is also applied to the subject and body text of the email messages.
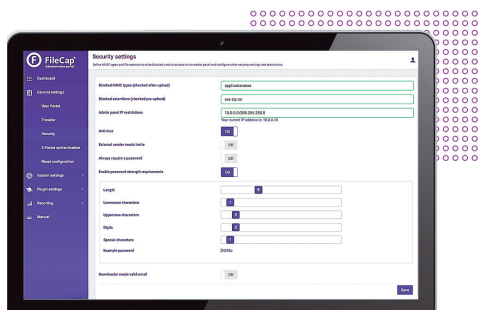

FileCap: maximum security and optimal ease of use, all in one.

With FileCap you can be sure that your files and email messages are only available for the desired recipients. FileCap uses advanced encryption methods to send your files and email messages. The sent files are saved individually encrypted on your own FileCap server within your own secured network. Your email conversation will take place in a secure portal on the same FileCap Server.

Technical specifications

Thanks to the extensive technical possibilities that FileCap offers, this solution can be used to optimally meet your company's policy and security requirements.

FileCap is available in the languages

Dutch - English - German - Swedish - Spanish - Italian - French - Finnish
