

Introduction to Environmental Sustainability

In an ideal world, all the materials and energy sources we use to support our lifestyles would be sustainable.

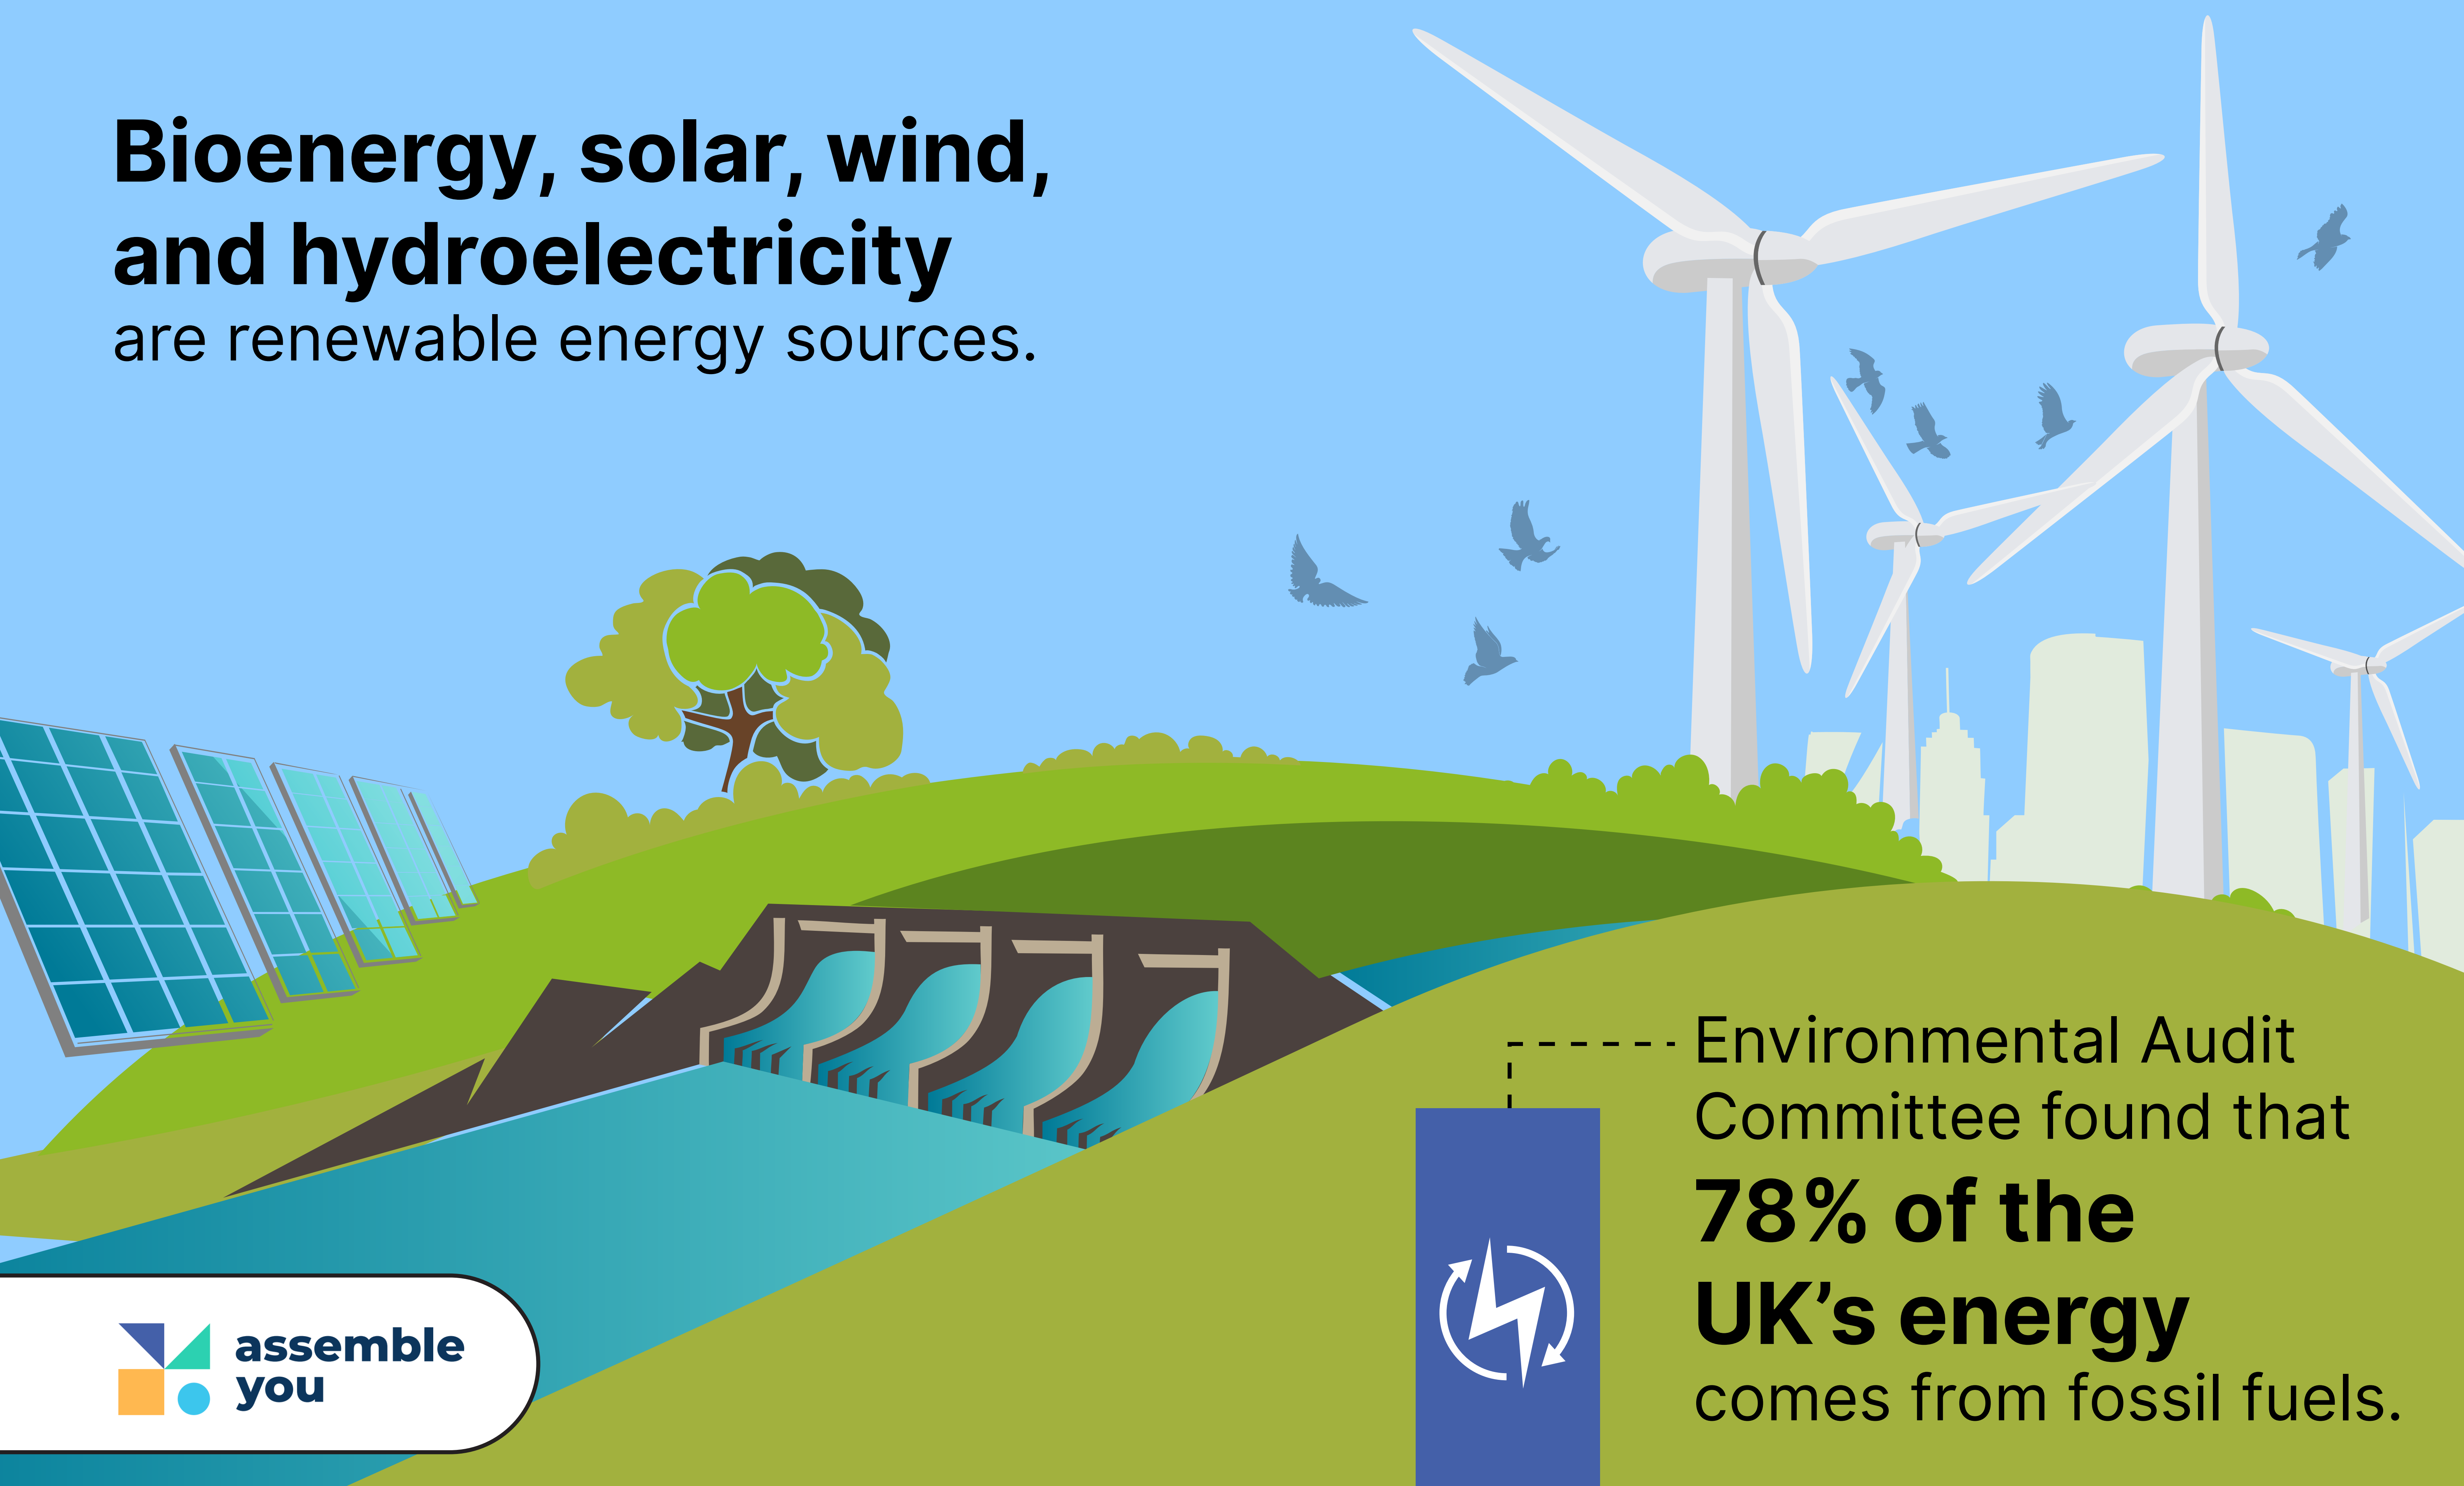

To support environmental sustainability in the commercial sphere, be a conscientious consumer.

A supply chain can be visualised as a chain link.

Each link relies on the other for sourcing, transport, and manufacturing. These chains link together to form a journey, with sourcing at the beginning and the business at the end.

Bioenergy, solar, wind, and hydroelectricity are renewable energy sources.

Environmental Audit Committee found that **78% of the UK's energy** comes from fossil fuels.
