THE DRIP/BUSD GARDEN

"Why does the value of my garden keep going down", "Why does the price always go down for plants?" "Will it ever go up?" "Wow I can withdraw \$100 a day? Should I invest that 5BNB?!"

**"Why does the value of my garden keep going down", "Why does the price always go down for plants?"
"Will it ever go up?" "Wow I can withdraw \$100 a day? Should I invest that 5BNB?!"**

These are the questions I always get, and they are all interesting in their own right...So let's explore a little of what's going on. Both the Piggy Bank and Drip Garden work on the same principles. Locked-stakes aside, they are almost identical.

The most important thing to remember about these is they use their respective in-game currencies, Piglets/Truffles in the Piggy Bank and Plants/Seeds in the Garden. USD have no value in-game. Plants or Piglets have no value anywhere aside from in-game. They have a fixed exchange rate to their in game counterparts, Seeds and Truffles. These do have a value and that value is fixed at 1/2,592,000th of a Plant/Piglet.

To keep things as simple as possible let us focus on the Garden, and just Seeds & Plants.

1 Plant = 2,592,000 Seeds

1 Plant produces 86,400 Seeds per 24hr period. This is where the 3.33% per day comes in, What's $30 \times 86,400$? You got it! 2,592,000.

1 Plant makes 1 Plant every thirty days, so 3.33% a day.

The reason the Plant/Seed value diminishes over time is that it works very much like blue chip stocks (NYSE/TSX/Bond markets), where the Market Cap is the Stock Price multiplied by the number of shares in circulation. In crypto, this is simply the number of tokens is multiplied by the token price.

If you try to envisage these products in the same way you will understand.

Every time someone compounds, the number of plants/seeds increases. If we look at the TVL or Contract Balance as the Marketcap it becomes very obvious that the more Plants/Seeds in the system and the more the market cap diminishes, the less valuable the in-game asset becomes. The less valuable they become, the less LP they can be exchanged into on the way out.

For example, if there's \$1m in TVL and 1m Plants inside the entire garden including everyone, then the Plants are worth \$1 each and the seed -since it's fixed, is one 2,592,000th of a dollar. On the other hand, if there's \$800,000 in TVL and 1.2m plants then each is worth \$0.66.

I have kept the numbers straightforward to make the calculations easier to grasp but that's the most basic way to understand it. When more TVL is added, what is often referred to as decay, actually slows down. The ratio of capital vs plants is increased, and thus, so do rewards.

Rewards are also affected by LP price. When the Drip price rises, the DripBUSD price also rises, and the value at which the Plants/Seeds can be exchanged for increases. The same is true in reverse. If the Drip price falls then the LP value falls and value of the rewards also dips.

In a perfect scenario with rising TVL and rising Drip price, rewards will be high. These are perfect opportunities to take some profits.

Conversely, when Drip price is falling and TVL is falling, then rewards will be low. This is perfect time to accumulate more plants.

Hope you enjoyed the above and we will update you shortly on more content hopefully on a weekly basis or as needed!
