

## What is MetaVoice?

MetaVoice is an application for desktops and mobile devices. The main advantage is ability of real-time change of your voice to another one using Artificial Intelligence algorithms as well as add secure signature to your voice and verify it. All MetaVoice products will be secured with NFT Tokens. The app will keep web3 standards, because users will log in using cryptocurrency wallet. The application will be integrated with VoiceStore - a library of voice models, that gives you unique identity to your voice.

### What is the use of MetaVoice?

Most of our customers - gamers - love to create their own heroes. Today they buy skins, e.g. pieces of clothing, another painting for a weapon that does not change its characteristics in battle. Our app will expand your character creation possibilities - by changing your voice in real-time. MetaVoice will allow you to adopt a voice according to the needs of the players and the type of hero. Players who want to feel better in the role of their hero will be able to change the voice in the game and speak like a troll, orc, a mage or any other suitable character.

Of course, there are a dozen other use cases: Metaverse (avatar creation), dubbing (in movies and games), and movie production (imagine Geralt from The Witcher could have the same voice in all languages in the world), resurrecting famous voices (e.g. Michael Jackson), Streaming, Marketing, Audiobooks, call center, medical, entertainment, security, anonymization.

-  Games
-  Dubbing/  
Movie production
-  Resurrect  
famous voices
-  Streaming
-  Entertainment/  
Content creation
-  Medical Industry
-  Anonymization

### Where will we get the voice models from?

Anyone will be able to create a voice model - a voice actor, a lector, or any other user of the MetaVoice application.

The voices will be divided into categories - commercial and consumer voices. Commercial voices will always be linked to the author's identity. This category will mainly include the voices of famous actors and actresses who will want to make their voice available in a marketing campaign for a product, game or film production.

Voices for general use will not need to be tied to a creator's identity, which means they can be used anywhere and by everyone.

We will also reach film studios for the voices of famous characters from movies or fairy tales.

## What is the role of VoiceStore?

VoiceStore will give you access to unique and exceptional voices belonging to voice actors, lecturers, fictional characters from your favourite movie productions and fairy tales and the MetaVoice community. On VoiceStore, you will be able to buy a voice for \$METAVOICE tokens and stand out from the competition or create your own voice model and earn passive money on it. VoiceStore will also provide the ability to easily, quickly and intuitively filter voices based on their characteristics.

## How It's Working?

The application will install a virtual microphone on your device and artificial neural networks will change your voice in real-time. Others will not hear your real voice, but you will be able to speak with the Voice NFT Model, which will be on your crypto wallet if previously purchased in the VoiceStore from the long list of voices available.

## What is „Voice ID NFT?“

Voice ID NFT is a virtual voice “fingerprint” secured with an NFT token. MetaVoice will provide a service for the creation of voice identifiers. Prepared according to the appropriate technical specification, the voice will be analyzed by our artificial intelligence algorithms. As a result of the analysis and calculations, a digital recording of the voice will be created, describing its features. Such the DNA of your voice. Voice ID NFT can be used as an invisibly „watermark” to soundtracks (social media streams) to confirm their origin and authenticity. The Voice ID NFT will not be detectable by the ear in the soundtrack, but will be recognized by the AI algorithms made available to MetaVoice users.

**Thanks to Voice ID NFT, we gain a tool to fight fake news and attempts to impersonate someone's identity.**

## Why blockchain technology is used in project?

Each voice model and Voice ID will be signed and secured with an NFT token. Thanks to this, no one will be able to steal and decrypt the data contained in the model or in the ID. Blockchain also allows us to trade voices easily and is a guarantee of security, ownership, uniqueness and anonymity (in the case of voices intended for general use).

## What stands out MetaVoice from the competition?

There are two types of products on the market that interfere with your voice. These are modulators and tools based on AI technology. Voice modulation tools (modulators) do not change your voice to another, but only distort your voice by applying various filters to it, making your voice sound unnatural. Among the AI technologies, we only have Speech-to-Text & Text-to-Speech solutions that deprive the voice of emotions or do not work in real-time.

MetaVoice combines the advantages of all products currently available on the market into one tool. MetaVoice gives you the ability to speak in real-time with any realistic voice, full of emotions, no matter what language you speak.

**With MetaVoice you can be whoever you want.**
