INTRODUCTION

In this documentation we will list all the steps required to access protected health information based on the documentation of an open API. The API makes health information broadly available using FHIR®, a set of clinical interoperability resources under the umbrella of the HL7 standards organization. FHIR is based on common web standards can be reached through a RESTful protocol in which each FHIR resource has a known URL. This document describes OAuth 2.0 for client applications to authorize, authenticate, and integrate with FHIR-based data systems.

We follow Smart-On-FHIR authentication (OAuth2) and authorization (Ref. <http://hl7.org/fhir/smart-app-launch/toc.html>)

FHIR Endpoints

Note: Production and Test Server endpoints are subject to change.

Production Endpoint

- FHIR : <https://fhir-api.chartpath.com:9443/fhir-server/api/v4/>
- Authentication Server: <https://fhir-oauth.chartpath.com/>

Test Server Endpoint

- FHIR : <https://fhir-api.chartpath.com:9443/fhir-server/api/v4/>
- Authentication Server: <https://fhir-oauth.chartpath.com/>

Types of Smart-On-FHIR applications

- Standalone App : SMART on FHIR confidential client with a patient context, refresh token, and OpenID Connect (OIDC) identity token.
- EHR Embedded app: Demonstrate the ability to perform an EHR launch to a SMART on FHIR
- Smart Backend Services App (Multi-patient authorization and API) : These are server-to-server backend applications e.g. Export clinical data for multiple patients in a group. This app is system level app without any UI.

Types of Authentications supported

- Symmetric (“client secret”) authentication ([HL7.FHIR.UV.SMART-APP-LAUNCH\Example App Launch for Symmetric Client Auth - FHIR v4.0.1](#))
- Asymmetric (“private key JWT”) authentication ([HL7.FHIR.UV.SMART-APP-LAUNCH\Example App Launch for Asymmetric Client Auth - FHIR v4.0.1](#))
- Public Clients ([HL7.FHIR.UV.SMART-APP-LAUNCH\Example App Launch for Public Client - FHIR v4.0.1](#))

Steps for Smart App Launch

1. Client App Registration
2. Retrieve .well-known/SMART-configuration
3. Obtain authorization code
4. Obtain access token
5. Access FHIR API

6. Refresh Token to obtain new access token

Client APP Registration

Before a SMART app can run against an EHR, the app must be registered with that EHR's authorization service. We are using OAuth 2.0 Client Registration.

Client App Request process

- Third-party application must sign the *API Subscription Agreement* with following details
 - The app name
 - The necessary APIs / Scopes
 - Any redirect URIs
 - Launch URL (optional)
 - URL to JWK Set (Only for apps supporting asymmetric client authentication).
- The application is created by the EHR admin after confirming the app's registration parameters and communicates a `client_id` to the app.
 - FHIR APIs (of any supported version) listed within the USCDI v1 core data set will be supported
 - Only reads data from FHIR server

Retrieve .well-known/smart-configuration

In order to obtain launch context and request authorization to access FHIR resources, the app discovers the EHR FHIR server's SMART configuration metadata, including OAuth `authorization_endpoint` and `token_endpoint` URLs.

FHIR server makes SMART configuration available from well-known endpoint. You can get Authorization end point and token endpoint.

Request

GET 200 [https://\[FHIRBaseURL\]/r4/.well-known/smart-configuration](https://[FHIRBaseURL]/r4/.well-known/smart-configuration)

Error codes

JSON response is returned from the FHIR Server along with the code

400: Bad Request
500: Internal Server Error

Obtain authorization code

The app supplies the following parameters to the EHR's "authorize" endpoint.

Parameters

<code>response_type</code>	<code>required</code>	Fixed value: <code>code</code> .
<code>client_id</code>	<code>required</code>	The client's identifier.
<code>redirect_uri</code>	<code>required</code>	Must match one of the client's pre-registered redirect URIs.
<code>launch</code>	<code>conditional</code>	When using the <code>EHR Launch</code> flow, this must match the launch value received from the EHR. Omitted when using the <code>Standalone Launch</code> .
<code>scope</code>	<code>required</code>	Must describe the access that the app needs, including scopes like <code>patient/*.rs</code> , <code>openid</code> and <code>fhirUser</code> (if app needs authenticated patient identity) and either: a <code>launch</code> value indicating that the app wants to receive already-established launch context details from the EHR a set of launch context requirements in the form <code>launch/patient</code> , which asks the EHR to establish context on your behalf. Please refer to the scopes supported in the table below
<code>state</code>	<code>required</code>	An opaque value used by the client to maintain state between the request and callback. The authorization server includes this value when redirecting the user-agent back to the client. The parameter SHALL be used for preventing cross-site request forgery or session fixation attacks. The app SHALL use an unpredictable value for the state parameter with at least 122 bits of entropy (e.g., a properly configured random uid is suitable).
<code>aud</code>	<code>required</code>	URL of the EHR resource server from which the app wishes to retrieve FHIR data. This parameter prevents leaking a genuine bearer token to a counterfeit resource server. (Note that in the case of an <code>EHR launch</code> flow, this <code>aud</code> value is the same as the launch's <code>iss</code> value.) Note that the <code>aud</code> parameter is semantically equivalent to the <code>resource</code> parameter defined in RFC8707 . SMART's <code>aud</code> parameter predates RFC8707 and we have decided not to rename it for reasons of backwards compatibility. We might consider renaming SMART's <code>aud</code> parameter in the future if implementer feedback indicates that alignment would be valuable. For the current release, servers SHALL support the <code>aud</code> parameter and MAY support a <code>resource</code> parameter as a synonym for <code>aud</code> .

Scopes Supported

Scope	Grants
<code>patient/*.read</code>	Permission to read and search any resource for the current patient (see notes on wildcard scopes below).
<code>user/*.read</code>	Permission to read and write all resources that the current user can access (see notes on wildcard scopes below).

Scope	Grants
openid	Permission to retrieve information about the current logged-in user.
fhirUser	
launch	Permission to obtain launch context when app is launched from an EHR.
launch/patient	When launching outside the EHR, ask for a patient to be selected at launch time.
offline_access	Request a refresh_token that can be used to obtain a new access token to replace an expired one, even after the end-user no longer is online after the access token expires.

Here's an example of an authorization request using HTTP GET. You will replace the [redirect_uri], [client_id], [launch_token], [state], [code_challenge], and [audience] placeholders with your own values.

Response

The EHR's authorization server reviews the request from your application. If approved, the authorization server redirects the browser to the redirect URL supplied in the initial request and appends the following querystring parameter.

- **code:** This parameter contains the authorization code generated by EHR, which will be exchanged for the access token in the next step.
- **state:** The exact value received from the client.

Here is how redirect URL will look like

Location: <https://app/after-auth?code=123abc&state=98wrghuwuogerg97>

https://inferno.healthit.gov/inferno/oauth2/static/redirect?code=SAMPLE_CODE.bGF1bmNoL3BhdGllbnQgb3BlbmlklGZoaXJvc2VylG9mZmxpbmVfYWNjZXNzIHBhdGllbnQvTVVkaWNhdGlvb15yZWFKlHBhdGllbnQvQWxsZXJneUludG9sZXJhbmlNLnJlYWQgcGF0aVVudC9DYXJIUGxhb15yZWFKlHBhdGllbnQvQ2FyZVRlYw0ucmVhZCBwYXRpZW50L0NvbmrpdGlvb15yZWFKlHBhdGllbnQvRGV2aWNlLnJlYWQgcGF0aVVudC9EaWFnbm9zdGliUmVvb3J0LnJlYWQgcGF0aVVudC9Eb2N1bVVudFJlZmVzW5jZS5yZWFKlHBhdGllbnQvRW5jb3VudGVyLnJlYWQgcGF0aVVudC9Hb2FsLnJlYWQgcGF0aVVudC9JbW11bmI6YXRpb24ucmVhZCBwYXRpZW50L0xvY2F0aW9uLnJlYWQgcGF0aVVudC9NZWRpY2F0aW9uUmVxdWVzdC5yZWFKlHBhdGllbnQvT2jZXJ2YXRpb24ucmVhZCBwYXRpZW50L09yZ2FuaXphdGlvb15yZWFKlHBhdGllbnQvUGF0aVVudC5yZWFKlHBhdGllbnQvUHJhY3R

After receiving the authorization code, your application trades the code for a JSON object containing an access token and contextual information by sending an HTTP POST to the token endpoint using a Content-Type header with value of "application/x-www-form-urlencoded".

Error codes

JSON response is returned from the FHIR Server along with the code

- 200: Ok
- 401: Unauthorized
- 400: Bad Request
- 500: Internal Server Error

Obtain access token

For public apps, authentication not required because a client with no secret cannot prove its identity when it issues a call. (The end-to-end system can still be secure because the client comes from a known, https protected endpoint specified and enforced by the redirect uri.)
For confidential apps, authentication is required. Confidential clients SHOULD use [Asymmetric Authentication](#) if available, and MAY use [Symmetric Authentication](#).

There are two different requests to get access token based on authentication type. In case of Symmetric ("client secret") authentication app issues an HTTP POST to the EHR authorization server's token endpoint URL using content-type application/x-www-form-urlencoded.
In case of Asymmetric authentication app, generate a client authentication assertion and prepare arguments for POST to token API:

Request

Parameters		
grant_type	required	Fixed value: authorization_code for symmetric and client_credentials for assymetric
Code	required	Code that the app received from the authorization server
redirect_uri	required	The same redirect_uri used in the initial authorization request
client_id	conditional	Required for public apps . Omit for confidential apps .
client_assertion_type	conditional	Required for asymmetric authentication. set to urn:ietf:params:oauth:client-assertion-type:jwt-bearer
client_assertion	conditional	Required for asymmetric authentication. set to a JWT signed with your dynamic client's private key
Scope	conditional	system/*.read for backend services type of application (bulk operations)

Error Handling

Error	Description

401 - Unauthorized	No valid Bearer token provided.
404 - Not Found	The requested resource doesn't exist.
5xx - Server Error	Something went wrong on FHIR Server side.

[OperationOutcome](#) explains the error reported

Profile audience and scope

This profile is intended to be used by developers of apps that need to access user identity information or other FHIR resources by requesting authorization from OAuth 2.0 compliant authorization servers.

The profile defines a method through which an app requests authorization to access a FHIR resource, and then uses that authorization to retrieve the resource. Synchronization of patient context is not addressed; for use cases that require context synchronization (e.g., learning about when the in-context patient changes within an EHR session) In other words, if the patient chart is changed during the session, the application will not inherently be updated.

Security and Privacy Considerations

App Protection

The app is responsible for protecting itself from potential misbehaving or malicious values passed to its redirect URL (e.g., values injected with executable code, such as SQL) and for protecting authorization codes, access tokens, and refresh tokens from unauthorized access and use. The app developer must be aware of potential threats, such as malicious apps running on the same platform, counterfeit authorization servers, and counterfeit resource servers, and implement countermeasures to help protect both the app itself and any sensitive information it may hold. For background, see the [OAuth 2.0 Threat Model and Security Considerations](#).

Specific requirements are:

- Apps SHALL ensure that sensitive information (authentication secrets, authorization codes, tokens) is transmitted ONLY to authenticated servers, over TLS-secured channels.
- Apps SHALL generate an unpredictable state parameter for each user session; SHALL include `state` with all authorization requests; and SHALL validate the `state` value for any request sent to its redirect URL.
- An app SHALL NOT execute untrusted user-supplied inputs as code.
- App SHALL NOT forward values passed back to its redirect URL to any other arbitrary or user-provided URL (a practice known as an "open redirector").
- An app SHALL NOT store bearer tokens in cookies that are transmitted as clear text.
- Apps SHOULD persist tokens and other sensitive data in app-specific storage locations only, and SHOULD NOT persist them in system-wide-discoverable locations.
