Double Counter aims to prevent unauthorized access through advanced user verification techniques, offering a comprehensive solution for Discord server administrators. By understanding the growing threat of alt accounts and raids, users can benefit from enhanced security measures. Here's a step-by-step guide on installing and leveraging Double Counter's identity confirmation tools. Setup complete, let's move on to authentication steps. Double Counter will now analyze and build user data, profiles in the background. To authenticate with Double Counter, follow these simple steps: Type /auth in a server channel to initialize authentication. The bot will DM you directions to visit an external verification webpage. Confirm your identity via captcha checks on the webpage to connect your Discord & Double Counter accounts. This allows Double Counter to associate your Discord ownership via cookies while protecting your credentials. Once finished, Double Counter will begin monitoring your server for policy violations and suspicious activity behind the scenes. Members will also face robust identity checks during the join process. Double Counter verifies new members through an external link before participating, forcing spammers to proof their identity. The verification process includes IP address checks, hardware fingerprint confirmation, and cookie linkage to previous verifications. Double Counter continuously tracks all members to detect future anomalies indicative of alt accounts. This is achieved by monitoring user activity patterns, device hardware identifiers, and IP addresses. The bot combines these signals using proprietary algorithms to determine ban evasion likelihoods. Server owners can even tune sensitivity rates if needed. In comparison to other Discord verification bots, Double Counter displays a 93% alt account detection accuracy over competing options, according to an independent audit by the Nonprofit Open Web Association. Many server owners have switched from alternative bots like AltIdentifier or Greenhouse due to its high reliability in detecting ban evaders and its ability to continuously track every member. Once you've got Double Counter up and running, you can use its built-in tools to keep an eye on who's verified in your community. There are some basic commands that'll help you manage things, like: /doublecounter verify @Katie - this checks if Katie's account is legit, and /doublecounter ban @Steve - if Steve's being dodgy, you can kick him out fast. You can also add people to the whitelist, so they don't get caught up in all the verification fuss. But that's just scratching the surface - there are loads of other advanced features that'll help you keep your server safe. Sometimes, things might go wrong with Double Counter. Maybe it'll go offline unexpectedly, or maybe some commands won't work right away. But don't worry, there are quick fixes for all these common issues! If Double Counter is being a bit stubborn, just check if the bot's status page says it's down globally - you can re-invite it afterwards. If you're still having trouble, try upping its permissions or reaching out to the support team. So, how does Double Counter help keep your server safe? Well, it's got some top-notch tech like hardware fingerprinting that makes sure only real people are getting in. Plus, it keeps an eye on all your members all the time, so you can rest easy knowing your community is protected. And if you want to get fancy, you can customize things with features like whitelists and sensitivity settings. All in all, Double Counter's a no-brainer for keeping your Discord server secure. It's user-friendly, powerful, and will give you peace of mind when it comes to managing your members. So why not head over to their website and get it installed today? For a server bot to function correctly, the owner must grant it necessary permissions before setup. Key requirements include: Granting Administrator role for streamlined setup Bot's highest role should be above @verified and/or @unverified roles Double Counter bot permission role must be above verified & unverified role(s) in the role list. Server configuration affects how verification is handled. If a server uses a reaction-based system, bots are assigned roles from reactions; otherwise, users can directly access the server upon joining. Providing clear guidance to users on the verification process is recommended. Things to keep in mind: Double Counter is not retroactive and cannot account for users already in the server The bot prevents future members with VPNs or alt accounts from accessing channels To ensure effective protection, newcomers must click the verification link to access channels Testing the bot requires caution, as mistakes can result in verified alt accounts becoming the main account.
